### CHANGE ORDER NO. 129

-ADDED NEW EMORY PEAK
-REVISED R.O.W. AT EMORY PEAK
-DELETED DRIVE #37
-ADDED / REVISED QUANTITIES

NOTE(S):

ALL DIMENSIONS ARE IN METERS UNLESS OTHERWISE NOTED.

FOR HORIZONTAL ALIGNMENT / DATA, SEE SHEET(S) 164 - 171.

FOR LIMITS OF SEEDING & TOPSOIL, SEE PROJECT X-SECTIONS AND TYPICAL SECTIONS.

FOR RIPRAP DETAILS, SEE PROJECT X-SECTIONS AND SHEET 342.

FOR RIPRAP ASSOCIATED WITH STORM DRAINAGE STRUCTURES SEE SHEET(S) 454 - 470.

(℄) SEE INTERSECTION LAYOUT / PROFILE SHEET FOR FURTHER DETAILS.

(#) REFERS TO CHANGES MADE AS PART OF CHANGE ORDER.

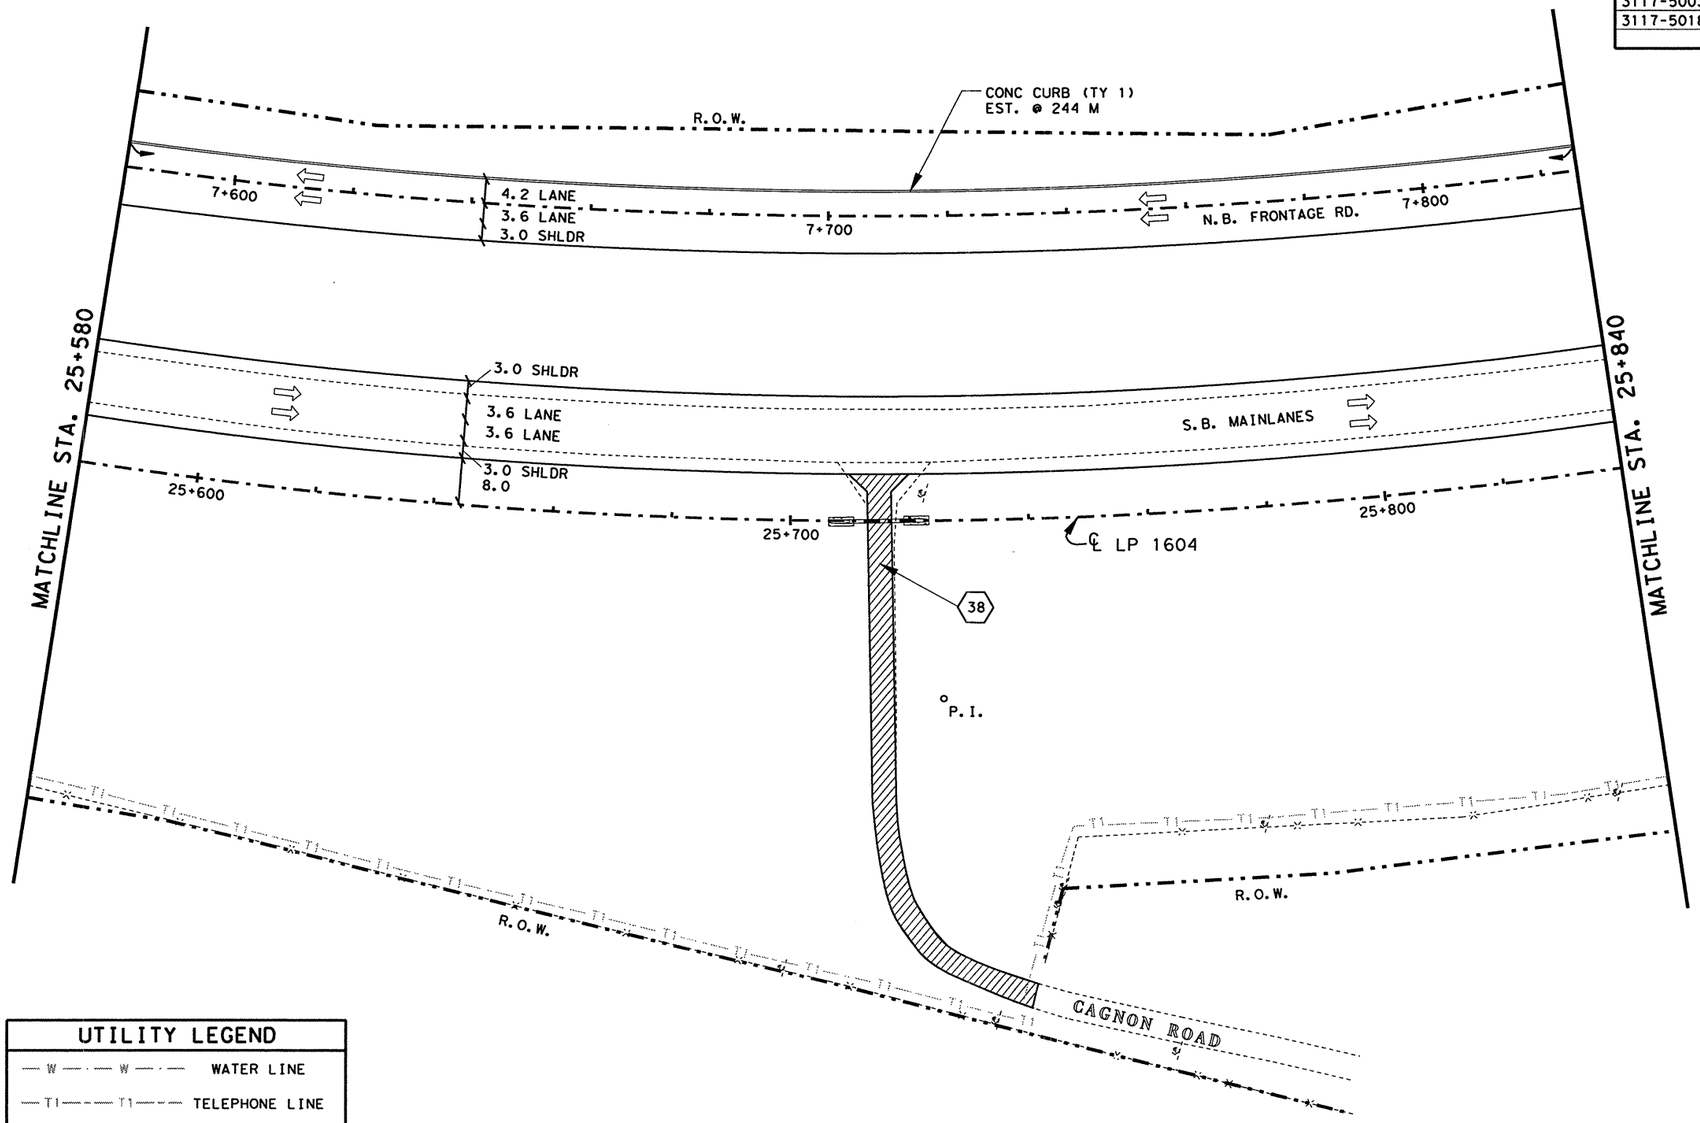
* FOR CONTRACTORS INFORMATION ONLY



NOTE(S):

ALL DIMENSIONS ARE IN METERS UNLESS OTHERWISE NOTED.

FOR HORIZONTAL ALIGNMENT / DATA, SEE SHEET(S) 164 - 171.

FOR LIMITS OF SEEDING & TOPSOIL, SEE PROJECT X-SECTIONS AND TYPICAL SECTIONS.

FOR RIPRAP DETAILS, SEE PROJECT X-SECTIONS AND SHEET 342.

FOR RIPRAP ASSOCIATED WITH STORM DRAINAGE STRUCTURES SEE SHEET(S) 454 - 470.

FOR ADDITIONAL STORM DRAIN INFO. REFER TO THE SPECIFIC STORM DRAIN PROFILE SHEET(S).

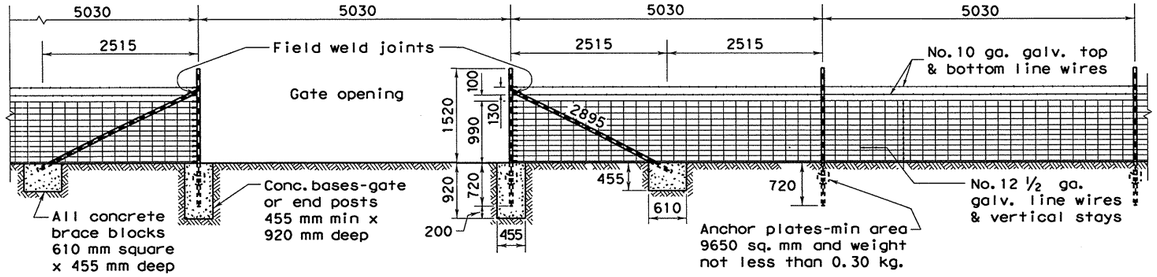
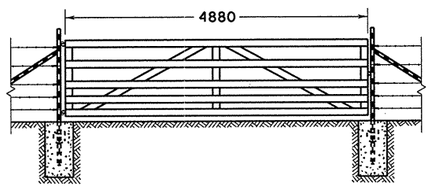
**SECTION GALVANIZED BARBED WIRE FENCE WITH METAL POSTS**
BRACING DETAIL USED AT ENDS AND GATES
**TYPE "C" FENCE**

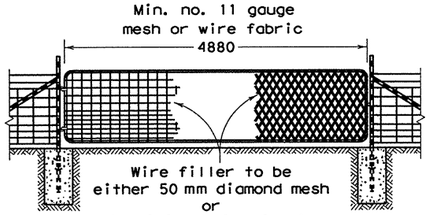


**SECTION GALVANIZED WOVEN WIRE FENCE WITH METAL POSTS**
BRACING DETAIL USED AT ENDS AND GATES
**TYPE "D" FENCE**

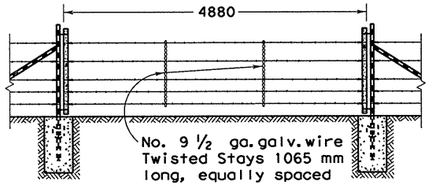
Metal gate shall consist of 5 panels not less than 1320 mm high and shall be aluminum or galvanized metal and of good quality. Gate and hardware shall meet the approval of the engineer.



**DETAIL TYPE 1 GATE**



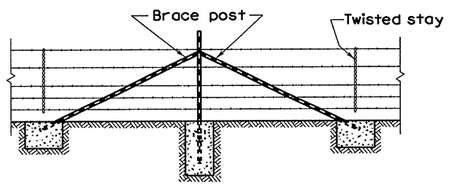
**DETAIL TYPE 2 GATE**



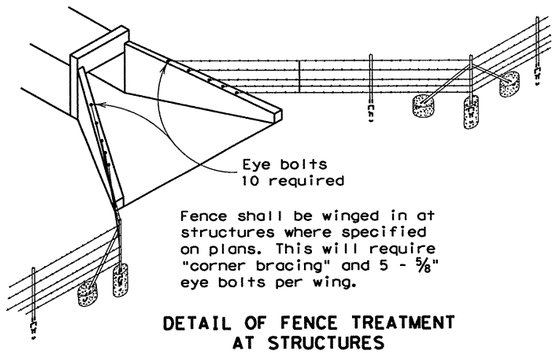
**DETAIL TYPE 3 GATE**

## GENERAL NOTES

1. Any high point which interferes with the placing of wire mesh shall be excavated to provide 50 mm clearance.
2. Latches for Type 1 and Type 2 gates shall be good commercial quality and design latch of the spring, fork or chain type. All latches shall be suitable to the gate and shall be approved by the Engineer.
3. Concrete shall be of the design and consistency approved by the Engineer and shall contain not less than 225 kg of cement per cubic meter.
4. Hinges for Type 2 gates shall be a commercial design approved by the Engineer suitable for post and gate.
5. Anchor plates shall be of a design and thickness sufficient to prevent turning of the post in firm soil. Metal end, corner and pull post shall be a minimum of 50 mm inside diameter pipe minimum (5.43 kg/lin meter) with minimum 32 mm inside diameter pipe brace minimum (3.38 kg/lin meter), minimum 65 mm x 65 mm x 6 mm angle (6.1 kg/lin meter) with minimum 50 mm x 50 mm x 6 mm angle brace (4.75 kg/lin meter) or other section approved by the Engineer. Fasteners for securing barbed wire or wire mesh to metal posts shall be a minimum of 11 gauge galvanized steel wire. Tubular posts shall be fitted with water tight malleable iron caps.
6. Metal line posts shall be not less than 1980 mm in length and shall weigh not less than 1.98 kg/lin meter.
7. The location of gates and corner posts will be as indicated elsewhere in these plans.

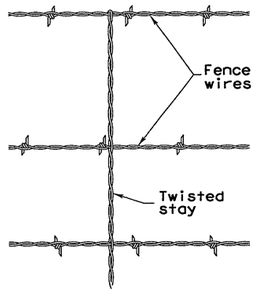


**CORNER OR PULL POST ASSEMBLY**

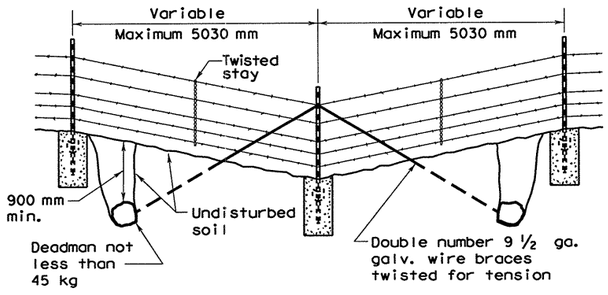


Fence shall be winged in at structures where specified on plans. This will require "corner bracing" and 5 - ⅝" eye bolts per wing.

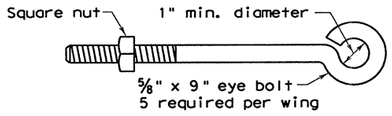
**DETAIL OF FENCE TREATMENT AT STRUCTURES**



**DETAIL OF STAY**



**DETAIL OF FENCE SAG**



**DETAIL OF EYE BOLT**

NOTES:

A BLOCKED OUT AREA AT LEAST 300mm LARGER THAN THE POST SHALL BE PLACED AROUND ALL POSTS.

IF REQUIRED, POSTS ON THE SINGLE GUARDRAIL TERMINALS WHICH HAVE SOIL PLATES SHALL BE 760mm BY AT LEAST 300mm LARGER THAN THE POST. THE 760mm DIMENSION IS FOR SOIL PLATE ACCESS.

AFTER THE GUARDRAIL IS INSTALLED, THE BLOCKED OUT AREA SHALL BE BACKFILLED WITH LOW STRENGTH GROUT AS APPROVED BY THE ENGINEER, FOR A DEPTH EQUAL TO THE CONCRETE DEPTH. LOW STRENGTH GROUT WILL BE SUBSIDIARY TO MOW STRIP. LOW STRENGTH GROUT WILL CONSIST OF TWO BAGS OF TY I HYDRAULIC CEMENT PER CUBIC YARD OF SAND.

CONCRETE SHALL BE CLASS B, RIPRAP.

RIPRAP SHALL BE PLACED TO A MINIMUM WIDTH OF 610mm FROM THE BACK OF THE POST.

ALL MEASUREMENTS ARE IN MILLIMETERS UNLESS OTHERWISE NOTED.

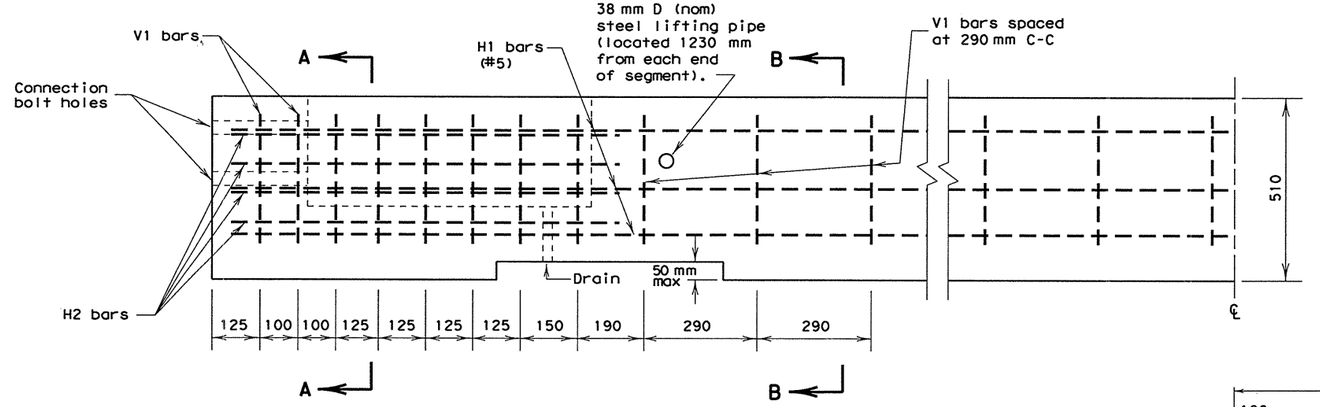
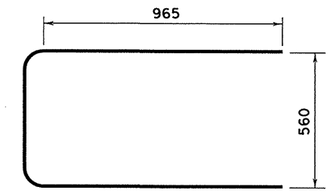
## PLAN VIEW - TYPE 1

(Symmetrical about center line)



## ELEVATION - TYPE 1

(Symmetrical about center line)

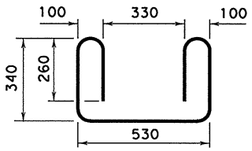


**H2 BAR (#5)**

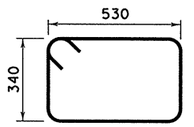
(Grade 420 min)

Note: H2 Rebar is to be bent at a 65 mm radius.

Note: All bending of shear rebar is at 45 mm radius unless specified otherwise.

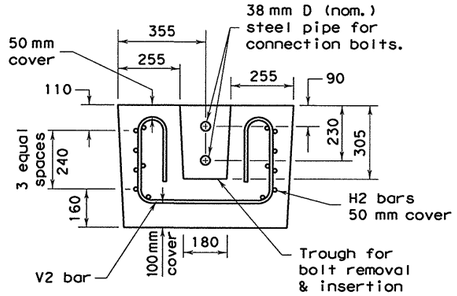


**V2 BAR (#4)**

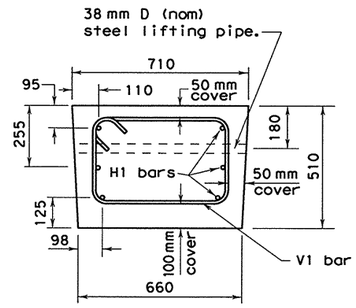


**V1 BAR (#4)**

## REINFORCING STEEL DETAILS



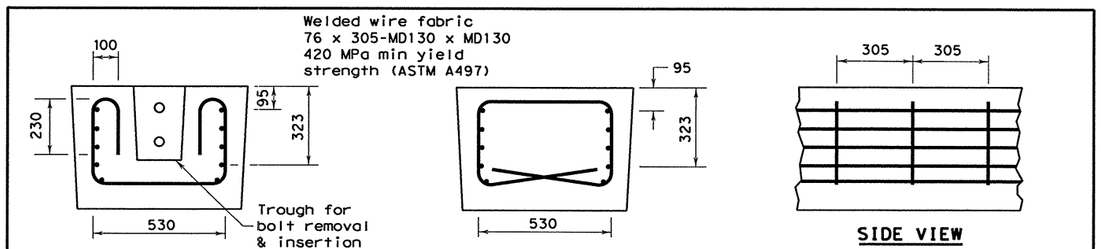
**SECTION A-A**



**SECTION B-B**

## GENERAL NOTES

1. Barrier length shall be 6100 mm (± 25 mm) unless otherwise specified in the plans.
2. All concrete, reinforcement, anchor bolts, blocking, and etc., as shown are considered as part of the barrier for payment.
3. All concrete shall be Class C or H, unless otherwise specified.
4. All reinforcing steel shall be Grade 300, unless otherwise specified.
5. Chamfer all edges 20 mm, as directed by the Engineer.
6. Steel pipe shall be hot dip galvanized in conformance to ASTM designation A123. Bolts, nuts and washers shall be hot-dip galvanized to ASTM designation A153.
7. Bolts shall conform to ASTM A36. Threads for bolts shall have a Class 2A tolerance and nuts shall have a Class 2B tolerance in accordance with ANSI B1.1.
8. The barrier should be light in color and should be supplemented by delineation as detailed elsewhere in the plans.



**SECTION A-A** **SECTION B-B** **SIDE VIEW**

Note: This fabric option can be used in place of V1, V2 and H1 bars. The H2 bars specified are still required.

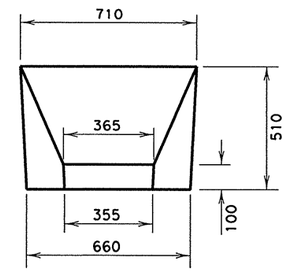
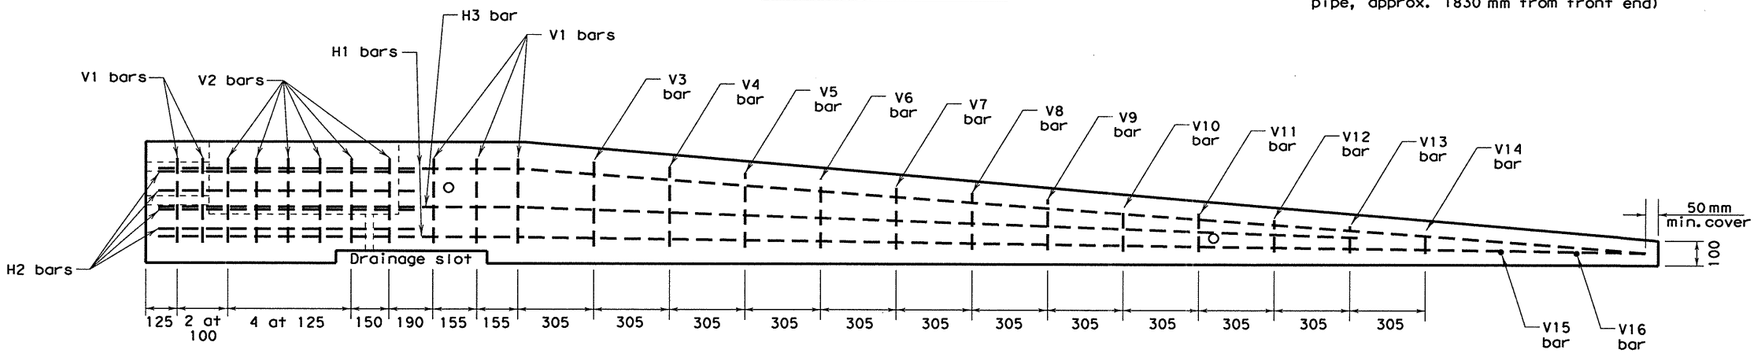
PLAN VIEW - TYPE 2



APPROACH VIEW



Note: Anchoring pipes not shown in elevation.

ELEVATION - TYPE 2

## GENERAL NOTES

1. Type 2 barrier shall be used as an end treatment for LPCB Type 1 barrier when appropriate.
2. The anchorage pins are all the same length and are intended to be driven flush with the top of the barrier surface.
3. The bends in the H3 and H1 bars are slight, no formal bend is necessary.
4. Type 2 barrier must be lifted from rear first to prevent cracking of sloped section.
5. See sheet 1 of 2 for additional information.

PLATE DETAIL

## JOINT TYPE B

### GENERAL NOTES

1. Where illumination is to be placed on concrete traffic barrier, a 3050 mm cast-in-place section shall be provided at each light pole location as shown on sheet CTBI(3). Ploe, anchor bolt, and other illumination details are shown on sheet CTBI(4).
2. Concrete shall be class C or H.
3. Regardless of the method of handling, barrier section lifting points shall be 1905 mm from the ends of the barrier. Lifting devices and attachments to barrier sections shall be as approved by the Engineer.
4. For joint Type A barrier that is installed in a temporary location, tiebars should be placed in the slot when the slot design option is used or, for the male-female design option, the male-female connections should be mated. Neither of the optional joint types should be grouted for temporary locations of barrier.
5. When installed in a permanent roadway location, end connections of the joint Type A barrier shall be grouted with a mixture of two parts sand and one part cement with enough water to make the mixture plastic. Grouting shall be done in a manner that will assure a smoth surface at the joint.
6. Surface finishing and grouting (where required) shall be considered subsidiary to the various bid items involved.
7. All steel fittings for Type B barrier shall be galvanized after fabrication.
8. Barrier length shall be 9140 mm ± unless specified elsewhere in the plans.
9. Forms shall be constructed of steel. Edges of barrier shall be rounded or chamfered as shown on sheet PCTB(2).
10. The contractor has the option of placing precast (joint Type A or B) or cast-in-place Type 2 Concrete Traffic Barrier as shown on sheet CTB(2) unless otherwise shown in the plans.

R = Radius
D = Diameter

All unit-less dimensions are millimeters

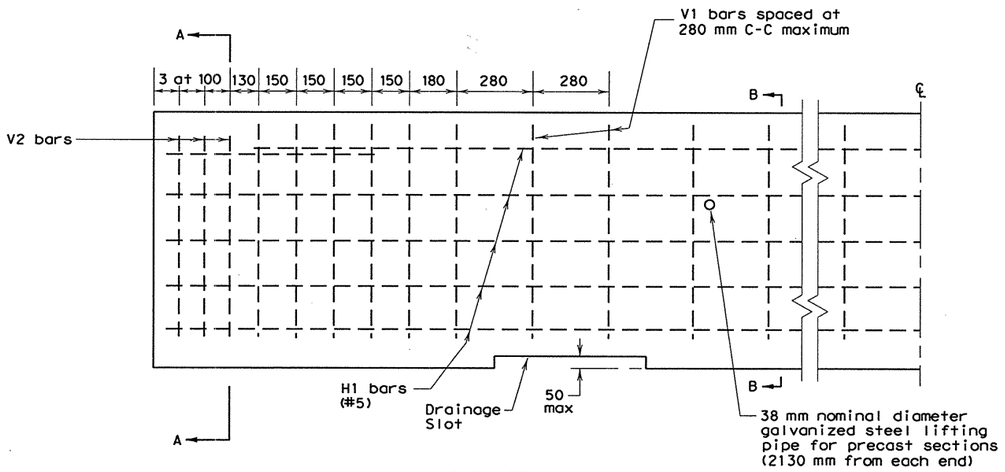
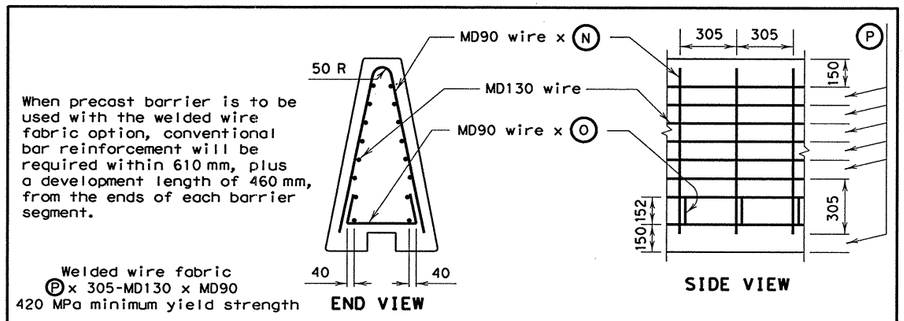
## PLAN VIEW

(SYMMETRICAL ABOUTCENTER LINE)



## ELEVATION

(SYMMETRICAL ABOUT CENTERLINE)



## WELDED WIRE FABRIC OPTIONAL REINFORCING

## GENERAL NOTES

1. Barrier length shall be 9140 mm (±25 mm) unless otherwise specified in the plans.
2. The usual temporary installation will require the placement of the rebar grid in the ungrouted slot. The usual permanent installation using precast barrier will connect the barrier segments with the rebar grid placed in the slot and grouted in place.
3. When installed in a permanent roadway location, the end connections of the precast barrier shall be grouted with a mixture of two parts sand and one part cement with enough water to make the mixture plastic. Grouting shall be done in a manner that will assure a smooth surface at the joint.
4. All concrete shall be class C or H, unless otherwise specified.
5. All reinforcing steel shall be Grade 420, unless otherwise specified.
6. Each precast barrier to be installed in a temporary location shall be delivered with a rebar grid.
7. Chamfer top and end edges 20 mm.
8. Unless otherwise shown in the plans, the Contractor has the option of placing either precast or cast-in-place permanent concrete barrier. Cast-in-place barrier may be slip formed. Additional reinforcement may be tack welded to the upper two-thirds of the reinforcing cage to provide bracing. Additional vertical bars shall be provided only to the extent necessary to position longitudinal steel within tolerances. Lifting pipe, rebar grid and slot shall be omitted for cast-in-place construction.
9. Bar splices for roadway barrier shall be a minimum of 24 times the nominal diameter of the bar.
10. Any method devised by the Contractor and approved by the Engineer that will assure the longitudinal roadway steel will be positioned ±10 mm as dimensioned will be satisfactory.
11. Welded wire fabric may be used as an option to conventional reinforcement for precast or cast-in-place barrier. Welded wire fabric shall be made in accordance with ASTM A 497.
12. Conduit will be provided only when called for elsewhere in the plans. The position of the conduit or conduit passageway may be adjusted to facilitate construction, subject to approval of the Engineer.
13. Transitions to barrier height, as needed, shall be determined by the Engineer. Changes in barrier height should not normally exceed 50 mm per 9140 mm. Vertical steel shall be uniformly transitioned throughout the variation in barrier height as directed by the Engineer.
14. A 920 mm minimum height differential between top of barrier and top of ACP shall be required at placement in order to allow for up to 150 mm of future overlays while maintaining a 770 mm minimum future effective height of barrier. Total minimal barrier height for design is therefore dictated by allowance for future overlays plus existing stairstep dimension "S". Minimums typically rounded to 1070 mm, 1220 mm, or 1370 mm to facilitate precasting.

| 7,500 | 74,223 | 12,079 | 12,158 | 13,421 | 12,158 | 12,441 | 39,840 | 12,709 | 12,362 |
| 9,000 | 88,701 | 14,436 | 14,514 | 16,022 | 14,514 | 14,797 | 47,611 | 14,436 | 14,718 |

RA = 9.65194 (RR+190) RB = 1.7340 (RR+240) RC = 5.1808 (RR+190)
LA1 = 1.5708 (RR+190) LB1 = 1.5708 (RR+240) LC1 = 1.5708 (RR+190)
LA2 = 1.5708 (RR+240) LB2 = 1.5708 (RR+420) LC2 = 1.5708 (RR+370)

The above arc length dimensions may be linearly ratioed for included θ angles other than 90°. The dimensions are intended as an aid in constructing forms for curved SSTR & Type T501 Railing.

Example: For RR = 3,000 mm & 80° ~ LA1 = 5,011 (8/9)

**DESIGN NOTES:**
The curved end treatment at bridge ends should only be used in areas where traffic speed is 64 km/h or less.

**GENERAL NOTES:**

The foundations indicated are suitable for mounting typical concrete bridge barrier type railings. The design resistance is based on the current AASHTO bridge railing requirements with the assumption of fair to good soil support conditions. Poor soil conditions will require suitably deeper foundations.

The primary use of the curved railing detail is to avoid the necessity of curved MBGF at the ends of bridges adjacent to grade intersections.

All concrete shall be Class C or better and all reinforcement shall be Grade 420.

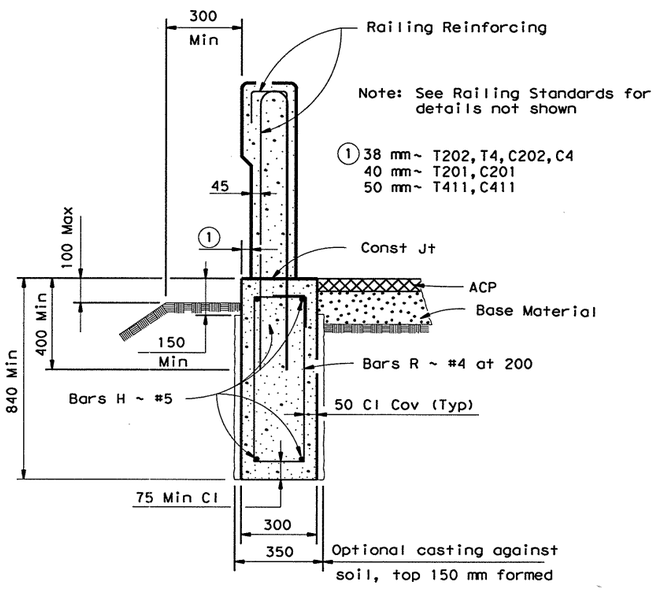
This detail is intended for use as a guide to unusual railing anchorage situations but may be included in the plans, modified as necessary to apply to specific installations required on the project.

Payment for railing foundations will be by cubic meters of Class C concrete.

The associated bridge railing will be paid for by the linear meter which includes the concrete and reinforcement.

Excavation will be considered subsidiary to other items.

All dimensions are in millimeters unless otherwise shown.



## NARROW BASE RAILING
## T201, T202, T4, T411, C201, C202, C4 & C411

Note: The above footings have approximately 0.25 m³/m of concrete and 16.03 Kg/m of reinforcement

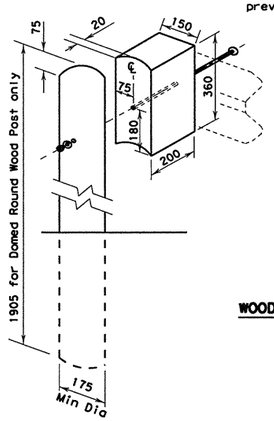
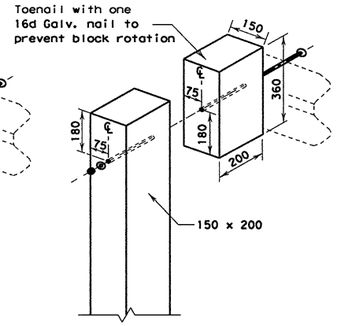
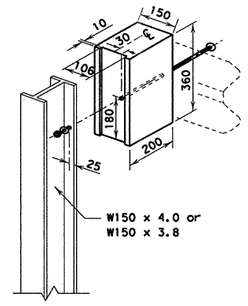
**TYPICAL POST**



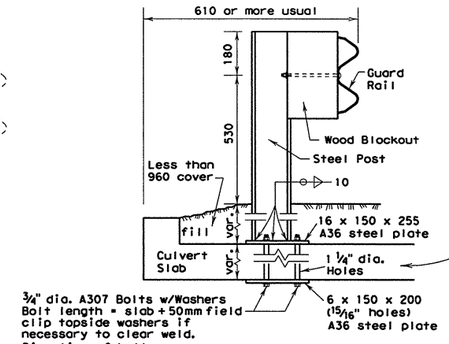
**WOOD BLOCKOUT TO ROUND WOOD POST DETAIL**



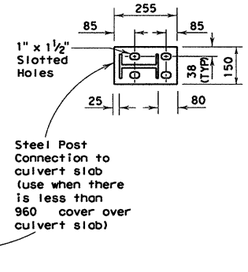
**WOOD BLOCKOUT TO RECTANGULAR WOOD POST DETAIL**

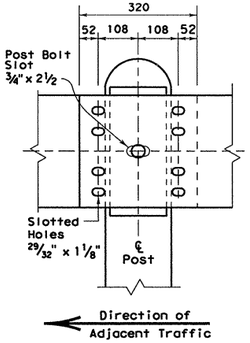


**WOOD BLOCKOUT TO STEEL POST DETAIL**

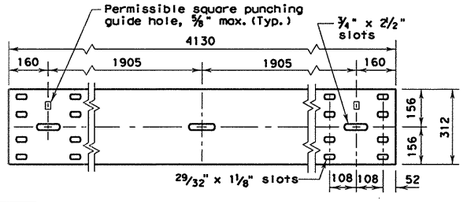


**LOW FILL CULVERT POST MOUNTING OPTION**





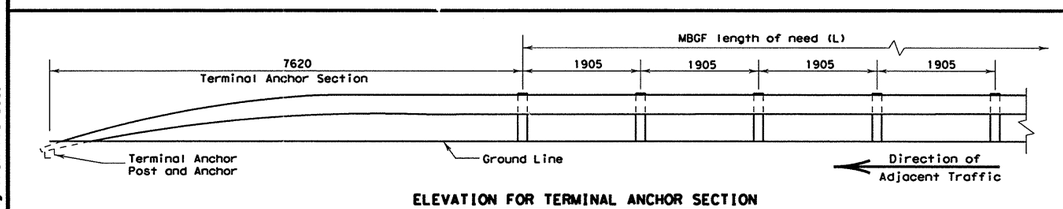
**RAIL SPLICE**



**ELEVATION OF NOMINAL 3810 mm FOOT GUARD RAIL**
(7620mm sections may also be supplied)

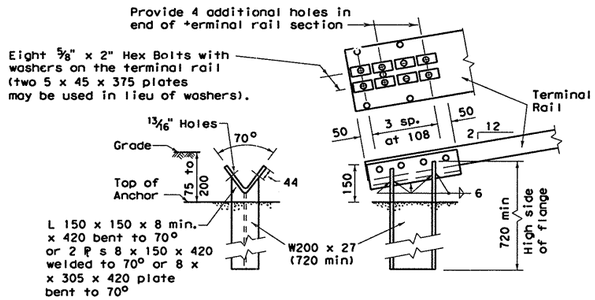
## GENERAL NOTES

1. The exact position of guard fence shall be as shown elsewhere on the plans or as directed by the Engineer. Guard fence shall be transitioned to a smooth connection with other guard fence or structure railing as shown elsewhere on plans.
2. Rail element shall meet all requirements of AASHTO M-180 except as modified on the plans. The terminal connectors shall be of the same material, but shall not be less than 10 gauge. Contractor shall verify that the locations of bolt holes match those in the Terminal Connector prior to ordering of materials.
3. Unless otherwise shown in the plans, guard fence placed in the vicinity of curbs shall be blocked out so that the face of curb is located directly below or behind the face of the blockout. Rail placed over curbs shall be installed so that the post bolt is located approximately 550 mm above the gutter pan or roadway surface.
4. Unless otherwise shown in the plans, MBGF shall be placed with the face of rail directly above the shoulder edge (or curbface) except for upstream end treatments.
5. At the option of the Contractor, the rail elements for the guard fence may be furnished in either 3810mm or 7620mm nominal lengths with post bolt slots for connection to posts.
6. The terminal anchor post shall be set in Class "A" concrete in (unless otherwise shown on plans) in accordance with Item, "Portland Cement Concrete". Concrete shall be subsidiary to the bid item requiring construction of the terminal rail section and anchorage system.
7. An anchor other than to a terminal anchor post shall consist of a connection similar to the rail splice or similar to the terminal connector.
8. Galvanized washers used with the eight 5/8" splice bolts and nuts that are provided for terminal connectors and/or terminal anchor posts shall be 1 3/4"x 3"x 3/16", or 1" i.d. and 2" o.d. x 0.134" (ANSI B27.2) narrow Type A plain washers.
9. Special fabrication will be required at installations having a curvature of less than 45 meter radius.
10. Bolts shall be of sufficient length to extend through the full thickness of the nut and no more than 20mm beyond it. (Button head bolts may be used instead of hex bolts when specified by the Engineer.) Fittings (bolts, nuts, and washers) shall be in accordance with Item, "Metal For Structures". Fittings shall be subsidiary.
11. Crown will be widened to accommodate guard fence.
12. If guardrail is placed on a side slope away from the pavement edge, then the slope rate between the edge of the pavement and the face of the barrier will be 1V:10H or flatter.
13. Posts shall not be set full depth in concrete.
14. Where solid rock is encountered or where shown on the plans, the diameter of the holes shall be approximately 305mm, the backfilling shall be with a cohesionless material, and embedment depth shall be 460mm or more as directed by the Engineer.
15. Unless otherwise directed by the Engineer, a composite material post and/or blockout from the Department approved list of suppliers may be substituted for a post or blockout of similar dimensions. The list of approved suppliers of blockouts will be maintained by the Construction Division, TxDOT.

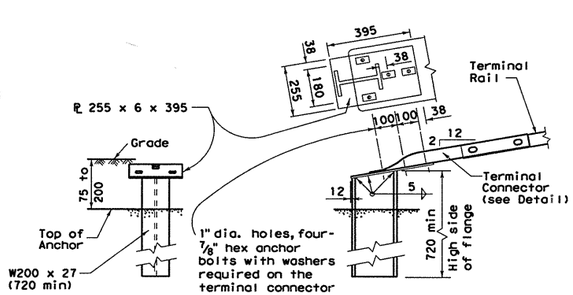


**ELEVATION FOR TERMINAL ANCHOR SECTION**

(Terminal anchor sections are only for downstream guardrail end anchorage usage outside the horizontal clearance area of opposing traffic)

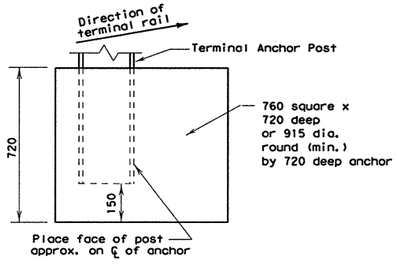


Note: This post requires four additional holes (shop or field) in the terminal rail member with eight 5/8" bolts and washer plates as shown for attachment.



Note: This optional post requires the use of the 10 ga. terminal connector with four 7/8" hex bolts for attachment to the anchor post.

**TERMINAL ANCHOR POST OPTIONS**

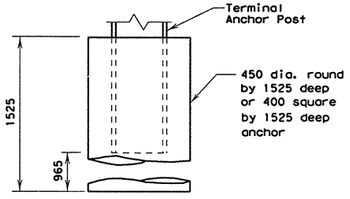


Notes: Either post may be used with either anchor.

No construction joint is allowed in the concrete anchor.

Terminal rail may be bolted to post and in twist position prior to placing concrete anchor.

If concrete anchor is precast, the area should be compacted as directed by the Engineer, when placed in the field.



**TERMINAL CONCRETE ANCHOR OPTIONS**

Ⓐ 1 1/4" spacer to steel post hex bolt. 2" rail to spacer button head bolt.

Ⓑ (7/8" hex bolts required for terminal connector)

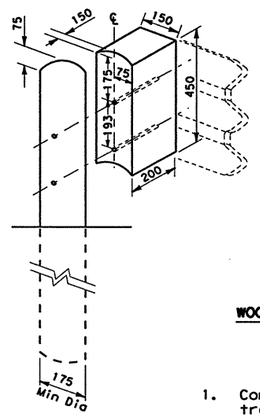
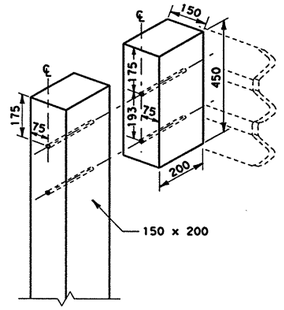
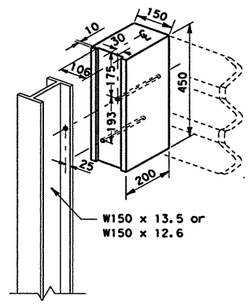
Washers (FWR03)(3"x 1 ¾"x 3/16" with 1"x ¾" slotted hole) under the head and nut will be required for the terminal connector to nested thrie beam splice bolts for these series rails.
See typical views and T5, SSTR, HT, CTB & SSCB Series Standard Sheets for additional details.



WOOD BLOCKOUT TO ROUND WOOD POST DETAIL



WOOD BLOCKOUT TO RECTANGULAR WOOD POST DETAIL



WOOD BLOCKOUT TO STEEL POST DETAIL

## GENERAL NOTES

1. Concrete curbs used in conjunction with thrie-beam guardfence transitions shall be Type II (typically 20mm height above surface; see CCCG standard sheet) unless otherwise shown in the plans. If other curb heights are shown in the plans in conjunction with the transition, this curb height may be from 100 mm to 200 mm with a relatively vertical face.
2. The type of post (round wood post, rectangular wood post, or steel post) will be shown elsewhere in the plans. The exact position of transitions shall be shown elsewhere in the plans or as directed by the Engineer. See MBGF standard sheet for additional details and information.
3. Rail element shall meet all requirements of AASHTO M-180 except as modified on the plans. The terminal connector and the thrie-beam transition to w-beam shall be of the same material, but shall not be less than 10 gauge.

   Contractor shall verify that the locations of bolt holes match those in the Terminal Connector prior to ordering of materials.
4. Unless otherwise shown in the plans, transitions shall be placed with the blockout face in front of or directly above the curbface.
5. Galvanized washers used with the ⅝" splice bolts and nuts that are provided for terminal connectors shall be (FWR03)(3"x 1 ¾"x 3/16" with 1"x ¾" slotted hole).
6. Button head post bolts (A307) shall be of sufficient length to extend through the full thickness of the nut and no more than 20mm beyond it. Button head spice bolts (A307) are ⅝" x 1 ¼" with a ⅝" double recessed nut. Galvanized fittings (bolts, nuts, and washers) shall be in accordance with Item, "Metal For Structures". Fittings shall be subsidiary to the bid item requiring construction of transition.
7. Crown will be widened to accommodate transitions.
8. Where solid rock is encountered or where shown on the plans, the diameter of the holes shall be approximately 305 mm, the backfilling shall be with a cohesionless material, and embedment depth shall be 450 mm or more as directed by the Engineer.
9. Posts shall not be set full depth in concrete.
10. Unless otherwise directed by the Engineer, a composite material post and/or blockout from the Department approved list of suppliers may be substituted for a post and/or blockout of similar dimensions. The list of approved suppliers of posts and blockouts will be maintained by the Construction Division, TxDOT.
11. Refer to MBGF Standard Sheet for additional details.

## GENERAL NOTES

1. The type of SGT unit will be specified elsewhere in the plans. (Numbers in circles indicate post position.)

| | Post & Tube | Post Only |
|---|---|---|
| Type I | Posts ① thru ② | Posts ③ thru ⑧ |
| Type II | Posts ① thru ④ | Posts ⑤ thru ⑧ |
| Type III | Posts ① thru ⑧ | None |

2. Wood posts are required with this guardrail end treatment.
3. All bolts, nuts, cable assemblies, cable anchors, steel tubes & bearing plates shall be galvanized.
4. For non-curb installations, the MBGF will be flared at a rate of 25:1 over the first 15240 mm of the system to prevent the terminal head from encroaching on the shoulder. The flare may be decreased or eliminated for specific installations if directed by the Engineer. A 25:1 flare rate will be used at curb sections, beginning at post number 5 and ending at post number one.
5. The steel tubes shall not protrude more than 100 mm above ground. Site grading may be necessary to meet this requirement.
6. The steel tubes may be driven with an approved driving head. They shall not be driven with the wood post in the tube. If the steel tubes are placed in drilled holes, the backfill material must be satisfactorily compacted to prevent tube settlement.
7. When rock excavation is encountered, a 305 mm diameter post hole, 510 mm deep may be used if approved by the Engineer. Granular material will be placed in the bottom of the hole approximately 65 mm deep to provide drainage. The steel tube sleeves will be field cut to 510 mm in length, placed in the hole and backfilled with adequately compacted material excavated from the hole.
8. The breakaway cable assembly must be taut. A locking device, (vice grips or channel lock pliers) should be used to prevent the cable from twisting when tightening the nuts.
9. The wood blockouts shall be "toe nailed" to the rectangular wood posts to prevent them from turning when the wood shrinks.
10. For curb installations, the soil tubes and posts shall be installed at the proper ground elevation behind the curb. The posts will then require field drilling new holes to accommodate the rail to post connection bolt to maintain the proper height of the rail above the gutter pan. The excess post length above the rail will be removed if directed by the Engineer.
11. An object marker shall be installed on the front of the impact head as detailed on D&OM(VIA).
12. A special site evaluation should be considered, prior to using this end treatment where there is less than 7620 mm between the outlet side of the end treatment and any adjacent driving lane.

## GENERAL NOTES

1. The type of SGT unit will be specified elsewhere in the plans. (Numbers in circles indicate post position.)

| | Post & Tube | Post Only |
|---|---|---|
| Type I | Posts ① thru ② | Posts ③ thru ⑧ |
| Type II | Posts ① thru ④ | Posts ⑤ thru ⑧ |
| Type III | Posts ① thru ⑧ | None |

2. Wood posts are required with this guardrail end treatment.
3. All bolts, nuts, cable assemblies, cable anchors, steel tubes & bearing plates shall be galvanized.
4. For non-curb installations, the MBGF will be flared at a rate of 25:1 over the first 15240 mm of the system to prevent the terminal head from encroaching on the shoulder. The flare may be decreased or eliminated for specific installations if directed by the Engineer. A 25:1 flare rate will be used at curb sections, beginning at post number 5 and ending at post number one.
5. The steel tubes shall not protrude more than 100 mm above ground. Site grading may be necessary to meet this requirement.
6. The steel tubes may be driven with an approved driving head. They shall not be driven with the wood post in the tube. If the steel tubes are placed in drilled holes, the backfill material must be satisfactorily compacted to prevent tube settlement.
7. When rock excavation is encountered, a 305 mm diameter post hole, 510 mm deep may be used if approved by the Engineer. Granular material will be placed in the bottom of the hole approximately 65 mm deep to provide drainage. The steel tube sleeves will be field cut to 510 mm in length, placed in the hole and backfilled with adequately compacted material excavated from the hole.
8. The breakaway cable assembly must be taut. A locking device, (vice grips or channel lock pliers) should be used to prevent the cable from twisting when tightening the nuts.
9. The wood blockouts shall be "toe nailed" to the rectangular wood posts to prevent them from turning when the wood shrinks.
10. For curb installations, the soil tubes and posts shall be installed at the proper ground elevation behind the curb. The posts will then require field drilling new holes to accommodate the rail to post connection bolt to maintain the proper height of the rail above the gutter pan. The excess post length above the rail will be removed if directed by the Engineer.
11. An object marker shall be installed on the front of the impact head as detailed on D&OM(VIA).
12. A special site evaluation should be considered, prior to using this end treatment where there is less than 7620 mm between the extrusion side of the end treatment and any adjacent driving lane.

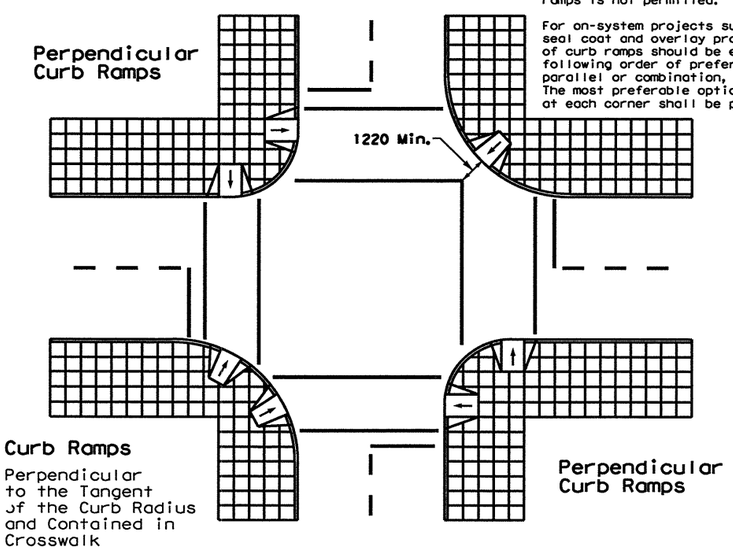
Note: Curb ramps with returned curbs instead of side flares are permitted where pedestrians would not normally walk across the ramp.

## TYPICAL INTERSECTION LAYOUT WITH OFFSET SIDEWALKS

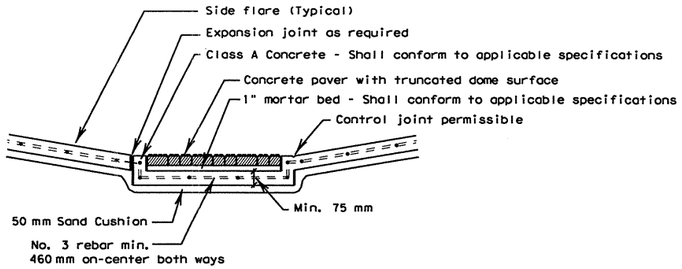
### Single Diagonal Curb Ramp

For on-system new construction, reconstruction and rehabilitation projects where pedestrian facilities are newly constructed or substantially altered, construction of single diagonal ramps is not permitted.

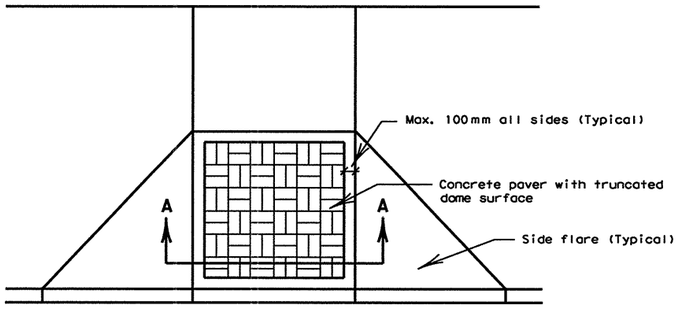
For on-system projects such as restoration, seal coat and overlay projects, placement of curb ramps should be evaluated in the following order of preference: perpendicular, parallel or combination, and single diagonal. The most preferable option that is feasible at each corner shall be provided.



## TYPICAL CURB RAMP PLACEMENTS AT INTERSECTIONS

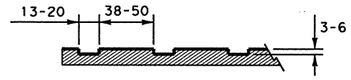


Section A-A

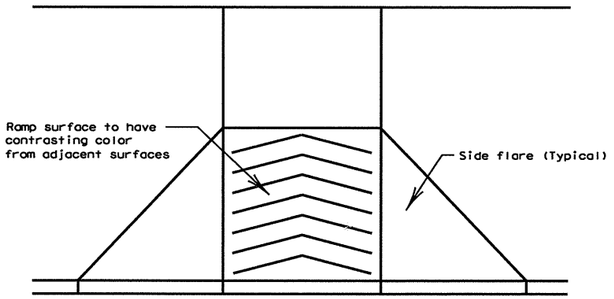


TYPE A

Truncated Dome Pattern Curb Ramp

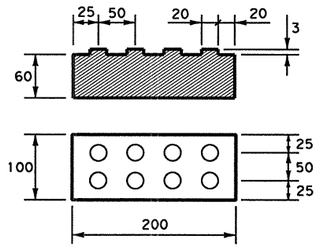


Groove pattern



TYPE B

Groove Pattern Curb Ramp
(15 Degree to Horizontal)



Concrete paver with truncated dome surface

### General Notes

Concrete paver units shall meet all requirements of ASTM C-936, C-33, and shall be laid in a two by two unit basket weave pattern, unless shown otherwise in the plans.

Concrete paver units shall have a truncated dome top surface for detectable warning to pedestrians.

Concrete paver unit color for the ramp shall be a contrasting color to the adjacent surfaces. The color of the concrete paver units shall be shown elsewhere in the plans. (Adjacent surfaces include side flares).

Concrete paver units shall be saw cut only and any cut unit shall be not less than 25 percent of a full unit.

## CURB RAMP TEXTURING

### General Notes

Concrete surface areas that are identified in the plans to receive sealer/stain treatment, shall not be treated w/ curing compound (retardant) and shall be allowed to cure a minimum of 30 days prior to application of the sealer/stain.

The sealer/stain for the ramp shall be a contrasting color to the adjacent surfaces (adjacent surfaces include the side flares). The color of the sealer/stain shall be shown elsewhere in the plans.

Sealer/stain shall be applied in accordance with applicable specifications.

Areas receiving sealer/stain treatment shall be cleaned using a "dry" (sand) blast cleaning method in accordance with applicable specifications.

All unit-less dimensions are millimeters

TYPE 22

COMBINATION ISLAND RAMPS

## General Notes

All slopes are maximum allowable. The least possible slope that will still drain properly should be used. Ramp length or grade of approach sidewalks may be adjusted as directed by the Engineer.

The minimum sidewalk width is 1525mm. Where a 1525 mm sidewalk can not be provided due to site constraints, a minimum 915 mm sidewalk with 1525 x 1525 passing areas at intervals not to exceed 61 meters is required.

Landings shall be 1525 x 1525 minimum with a maximum 2% slope in any direction.

Maneuvering space at the bottom of curb ramps shall be a minimum of 1220 x 1220 wholly contained within the crosswalk and wholly outside the parallel vehicular travel path.

Maximum allowable cross slope on sidewalk and ramp surfaces is 2%.

Curb ramps with returned curbs may be used only where pedestrians would not normally walk across the ramp. Otherwise, flared sides shall be provided.

All concrete surfaces shall receive a light broom finish unless noted otherwise in the plans.

Ramp textures must consist of truncated domed surfaces. Textures are required to be detectable underfoot. Surfaces that would allow water to accumulate are prohibited.

Additional information on curb ramp location, design, light reflective value and texture may be found in the current edition of the Texas Accessibility Standards (TAS) prepared and administered by the Texas Department of Licensing and Regulation (TDLR).

Raised medians separate opposing directions of traffic and provide a refuge area for pedestrians unable to cross the entire roadway in the allotted signal phase. To serve as a refuge area, the median should be a minimum of 1525 mm wide. Medians should be designed to provide accessible passage over or through them.

Small channelization islands, which can not provide a minimum 1525 x 1525 landing at the top of ramps, shall be cut through level with the surface of the street.

Crosswalk dimensions, crosswalk markings and stop bar locations shall be as shown elsewhere in the plans. At intersections where crosswalk markings are not required, ramps shall be aligned with theoretical crosswalks, or as directed by the Engineer.

Existing features that comply with TAS may remain in place unless otherwise shown on the plans.

Handrails are not required on curb ramps. Curb ramps shall be provided wherever an accessible route crosses (penetrates) a curb.

Shaded areas indicate locations of detectable warnings. (Color / light reflective value and texture contrast)

Curb ramps and landings shall be constructed and paid for in accordance with Item, "Curb ramp and Landing". Street curb transitions and curb bevels will be paid for in accordance with Item, "Concrete Curb, Gutter and Combined Curb and Gutter".

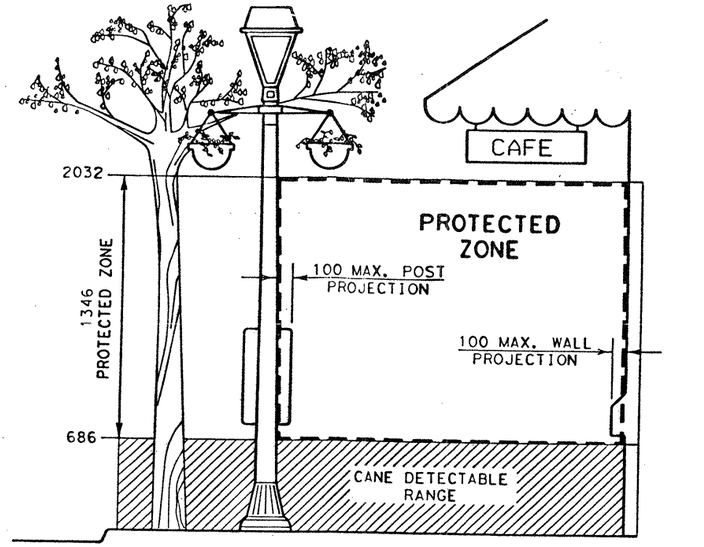
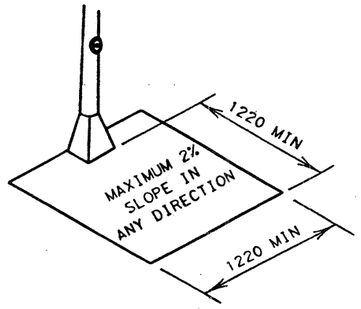
## SIDEWALK TREATMENT AT DRIVEWAYS

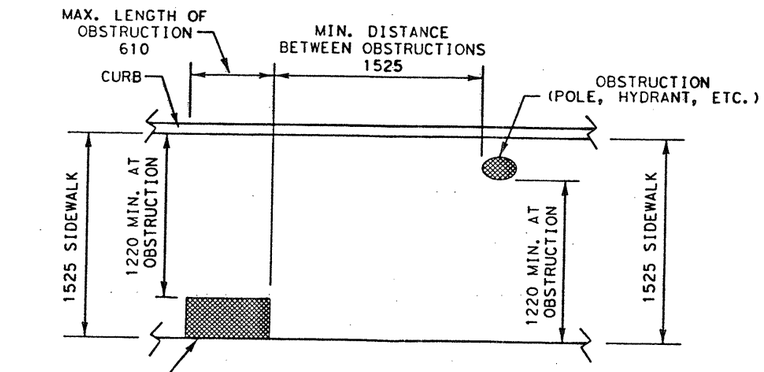


## PROTECTED ZONE

In pedestrian circulation area, maximum 100 mm projection for post or wall mounted objects between 686 mm and 2032 mm above the surface.



## CLEAR GROUND SPACE AT PEDESTRIAN PUSH BUTTON



PLAN VIEW

## PLACEMENT OF STREET FIXTURES

(ITEMS NOT INTENDED FOR PUBLIC USE. MINIMUM 1220 x 1220 CLEAR GROUND SPACE REQUIRED AT PUBLIC USE FIXTURES.)

### General Notes

All slopes are maximum allowable. The least possible slope that will still drain properly should be used.

Traffic signal or illumination poles, ground boxes, controller boxes, signs, drainage facilities and other items shall be placed so not to obstruct the accessible route.

Usual sidewalk cross slope equals 1.5%. The maximum allowable sidewalk cross slope equals 2%.

Street grades and cross slopes shall be as shown elsewhere in the plans.

Existing features that comply with TAS may remain in place unless otherwise shown on the plans.

Changes in level greater than 6.35 mm are not permitted.

Any part of the accessible route with a slope greater than 1:20 (5%) shall be considered a ramp. If a ramp has a rise greater than 150 mm or a horizontal projection greater than 1830 mm, then it shall have handrails on both sides, with the following exceptions:

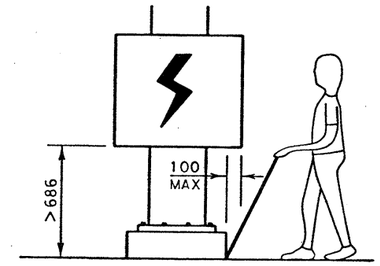
At ramp sidewalks shown at far left.

Handrails are not required on curb ramps. Curb ramps shall be provided wherever an accessible route crosses (penetrates) a curb.

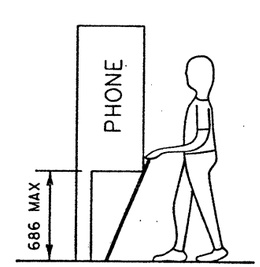
The least possible grade should be used to maximize accessibility. Where structurally impractical to achieve TAS compliance, the running slope of sidewalks and crosswalks, within the public right of way, may follow the grade of the parallel roadway without invoking Texas Accessibility Standards (TAS) variances for landings or handrails. Where a continuous grade greater than 5% must be provided, handrails may be desirable on one or both sides of the sidewalk to improve accessibility. Handrails may also be needed to protect pedestrians from potentially hazardous conditions.

Parabolic crowns may require adjustment in crosswalk areas to limit the crosswalk grade to 5%.

Driveways and turnouts shall be constructed and paid for in accordance with Item, "Driveways and Turnouts". Sidewalks shall be constructed and paid for in accordance with Item, "Sidewalks".



When an obstruction of a height greater than 686 mm from the surface would create a protrusion of more than 100 mm into the pedestrian circulation area, construct additional curb or foundation at the bottom to provide a maximum 100 mm overhang.



Protruding objects of a height ≤ 686 mm are detectable by cane and do not require additional treatment.

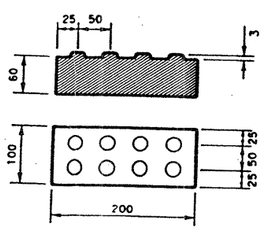
DETECTABLE WARNINGS



Concrete paver with truncated dome surface

### General Notes

Concrete paver units shall meet all requirements of ASTM C-936, C-33, and shall be laid in a two by two unit basket weave pattern, unless shown otherwise in the plans.

Domes shall be aligned in the direction of pedestrian travel.

Concrete paver units shall have a truncated dome top surface for detectable warning to pedestrians.

Concrete paver unit color for the ramp shall be a contrasting color that provides a light reflective value that significantly contrasts with the adjacent surfaces. The color of the concrete paver units shall be shown elsewhere in the plans. (Adjacent surfaces include side flares).

Concrete paver units shall be saw cut only and any cut unit shall not be less than 25 percent of a full unit.

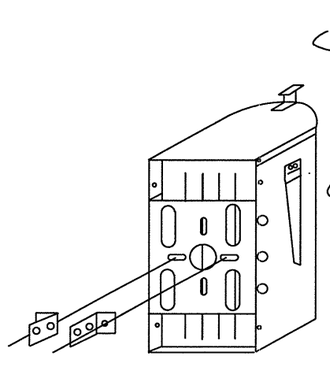
SECTION B-B

For bolt sizes see notes for
Standard Mailbox Attachments Details

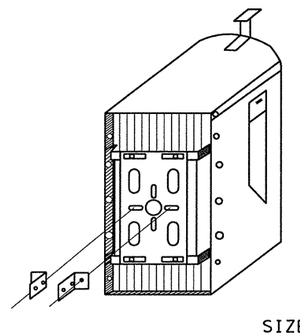
## MULTIPLE MAILBOX MOUNT

## TWO OR MORE MULTIPLE MAILBOX INSTALLATIONS

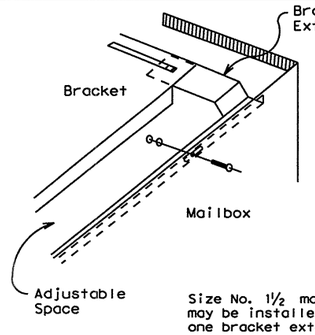
1220 mm Clear Distance
between installations.



SIZE NO. 1 MAILBOX



SIZE NO. 1 1/2 AND NO. 2 MAILBOX



Size No. 1½ mailbox may be installed using one bracket extension.

Bracket to mailbox attachment:
6 - 1/4" Dia. x 3/4" bolt w/2 flat
washers and nut per each bolt.

Bracket to bracket extension attachment:
2 - 1/4" Dia. x 3/4" carriage bolt w/
flat washer, lock washer and
nut per bolt (4 bolts required if 2
bracket extensions are used).

Angle to bracket attachment:
2 - 3/8" Dia. x 3/4" bolt w/2 flat
washers, lock washer and nut per each
bolt.

Angle to mailbox support attachment:
2 - 3/8" Dia. x 2 1/2" bolt w/2 flat
washers, lock washer, and nut per each
bolt.

## STANDARD MAILBOX ATTACHMENT DETAILS

For General Notes See sheet 2 of 3.

See Sheet 3 of 3 for Adapter Plate, Angle Bracket and Bracket Extension Hardware Details.

Bracket may be installed with edge down on size No. 1 mailboxes.

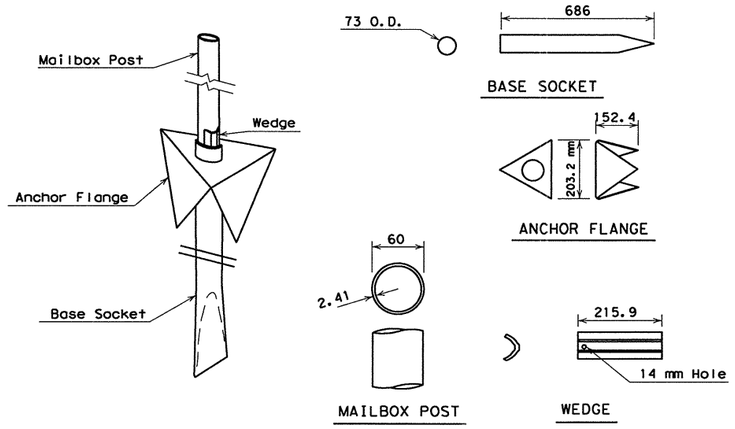
*See General Note 6.

## TYPE 1 SUPPORT/FOUNDATION

THIN WALL STEEL TUBE w/ V-LOC ANCHORAGE



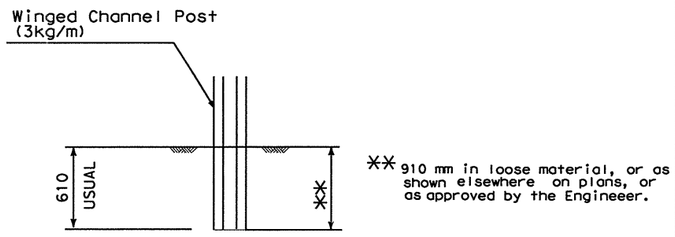
All dimensions may be varied to fit 60 mm thin wall steel tube post if approved by Engineer

## TYPE 2 SUPPORT/FOUNDATION

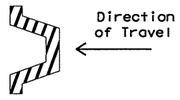
THIN WALL STEEL TUBE w/ANCHOR FLANGE

NOTES FOR TYPE 2 SUPPORT/FOUNDATION

1. The Base Socket is formed from 73 mm O.D. x 12 gauge galvanized pipe.
2. The Anchor Flange is formed from 12 gauge galvanized steel made to A-525. Only needed for soft soils as determined by the Engineer.
3. The Wedge is formed from 11 gauge galvanized steel made to ASTM A-525.
4. The Mailbox Post is 60 mm O. D. 2.41 mm thin wall steel tubing.
5. Steel Support Foundation unit shall be made from new material and shall be corrosion resistant. The unit shall be galvanized in accordance with ASTM designation A-123, A-525, G-90 or better. In addition, steel members of the support that are in direct contact with earth must be galvanized to ASTM Designation G-90 and coated with one mil of clear approved coating, or galvanized in accordance with ASTM Designation A-123.



** 910 mm in loose material, or as shown elsewhere on plans, or as approved by the Engineeer.



Recommended orientation to facilitate attachment of Object Marker.

DELINEATOR POST
3 kg/m

## TYPE 3 SUPPORT/FOUNDATION

DELINEATOR POST

GENERAL NOTES

1. Bolts, nuts, washers and other miscellaneous hardware shall be galvanized in accordance to ASTM Designation: A-153, Class C or D, or B-454, Class 40. All bolts shall meet ASTM designation A-307.
2. Foundation and post must be driven plumb. Recommended procedure is to drive post or foundation about 280 mm, stop and check for straightness, front to back, side to side. Make adjustments, continue to drive an additional 280 mm, repeat check, make final adjustments, complete installation.
3. The 3 kg./m. winged channel posts for the Type 3 support shall conform to the requirements of departmental materials specification D-9-7130.
4. Hardware for mounting mailboxes to support/foundation furnished by Foresight Industries or equivalent may be used when approved by the Engineer.
5. Where more than two mailboxes are to be mounted at one location a multiple mailbox mount shall be used.
6. The formed tube support frame for the multiple mailbox mount and the Type 1 mailbox support system are patented and manufactured by Foresight Products Inc.
7. Any support or foundation on these standards may be used for mounting single or double mailboxes.

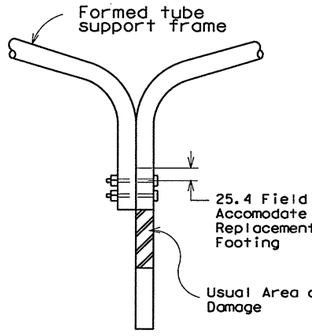
Object Marker Notes:

Object Markers for mailbox support should be the OM-2SR or OM-2VP (152.4 mm x 304.8 mm). Object markers shall conform to Department Material Specification D-9-8600. Attachment of Object Marker to support may be:

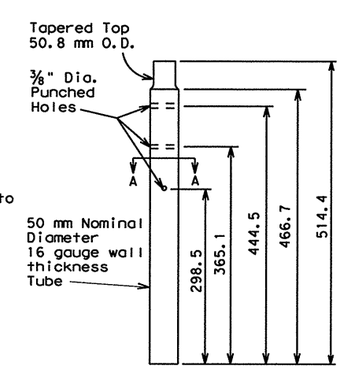
1) For round or tubular support, with pressure sensitive adhesive.
2) For winged channel support, with reflective material on aluminum or plastic substrate and attached by nut/bolt with washers or pop rivet.

The marker is to be placed between 150 mm and 300 mm below the bottom of the mailbox.

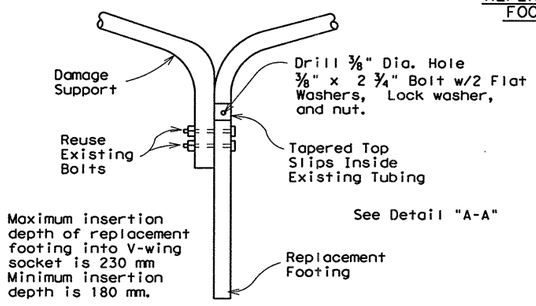
On two-way two lane highways, a marker is to be placed on each side of the support.



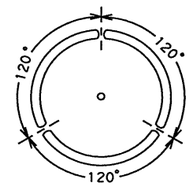
TYPICAL MULTIPLE MAILBOX MOUNT



REPLACEMENT FOOTING



REPAIR DETAIL



DETAIL "A-A"

3 - 9.5 mm Dia. Punched Holes to Create Weakened Section

NOTES:

Only damaged multiple mailbox mounts having no visible damage other than to the portion of the footing that is to be discarded may be repaired.

Material for the repair footing is to be AISI-1008 hot rolled carbon steel. The unit shall be galvanized.

Hardware for mounting mailboxes to support/foundation furnished by Foresight Industries or equivalent may be used when approved by the Engineer.

The bracket and bracket extension shall be constructed of 14 gauge galvanized steel sheet conforming to ASTM A-525(G-90).

The angle shall be constructed of 14 gauge steel sheet and the adapter plate shall be constructed of 12 gauge steel sheet. The angle and adapter plate shall be fabricated in accordance with ASTM A-123 or constructed of galvanized steel sheet conforming to ASTM A-525(G-90).

Items with evidence of damage to the galvanized coating or wet storage stains (white rust) will not be accepted.

All unit-less dimensions are in millimeters.

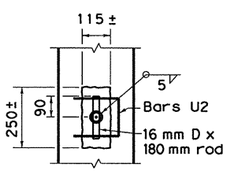
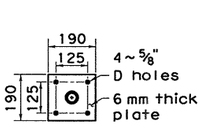
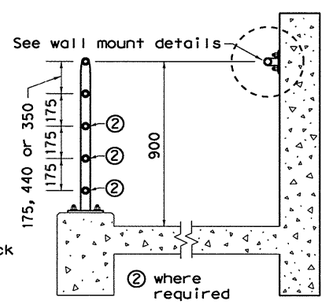
## RAIL POST WITH CURB



## EMBEDDED POST ANCHOR



## BASE PLATE DETAILS



## COMBINATION OF HANDRAIL ON WALL AND RAMP

GENERAL NOTES:

Design conforms to Texas Accessibility Standards and AASHTO 1993 Standard and current Interim Specifications.

See Sidewalk and Ramp details for ramp slope, dimensions and typical concrete and reinforcing steel. This sheet shows additional reinforcing steel required for handrail only.

Material for posts and handrails shall be ASTM A53 Gr B, or A501. Base plates shall be A36. All parts shall be galvanized in accordance with the specifications.

Square tubing of equivalent outside dimensions and strength may be substituted for the round shapes shown, as directed by the Engineer.

Anchor bolts for handrails attached to the wall shall be placed using an adhesive doweling system approved by the Engineer. Anchor bolts shall have an allowable capacity of 10.68 kN in tension and 10.23 kN in shear. Installation of the anchor bolts, including hole depth and diameter, shall be in accordance with the manufacturer's recommendation. If required by the Engineer, 3 of the first 10 anchors, and 5% of the remaining anchors shall be tested to 70% of minimum specified capacity. The contractor shall provide a suitable ram, pump, pressure gauge and reaction system.

Anchor bolts for posts attached on the ramps shall conform to ASTM A36 or approved equal. Nuts for anchor bolts shall conform to ASTM A563 Gr A or better heavy hex. Threads for anchor bolts and nuts shall be rolled or cut threads of unified national coarse (UNC) thread series. Bolts and nuts shall have class 2A and 2B fit tolerances. Anchor bolts and exposed nuts shall be galvanized or coated with zinc-rich paint. Washers shall be galvanized. Anchor bolts in ramp and sidewalk may be anchored using a drill and grout system.

Exposed edges of handrail and handrail posts shall be rounded or chamfered to approximately 3 mm by grinding.

Anchor bolts, nuts and washers to be included in unit price bid for railing.

Erection drawings showing panel lengths, splice locations, rail post spacing and anchor bolts setting shall be submitted to the Engineer for approval.

R = Radius
D = Diameter

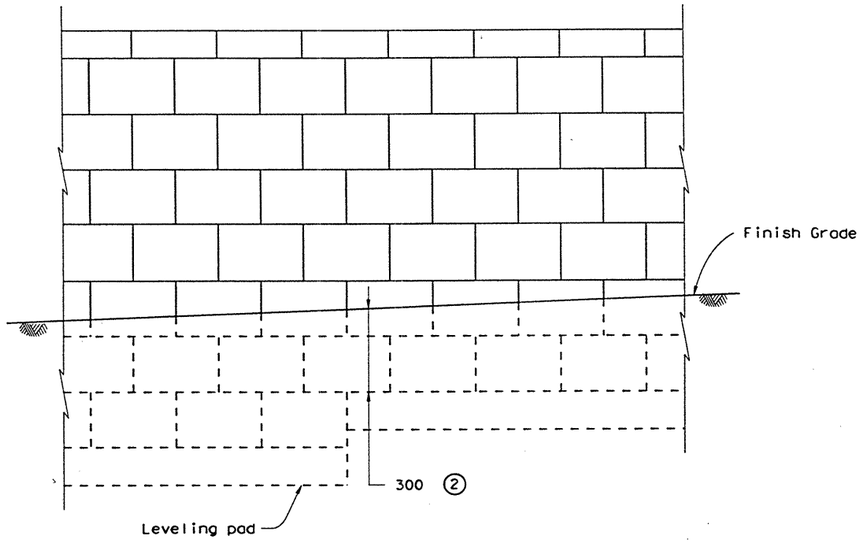
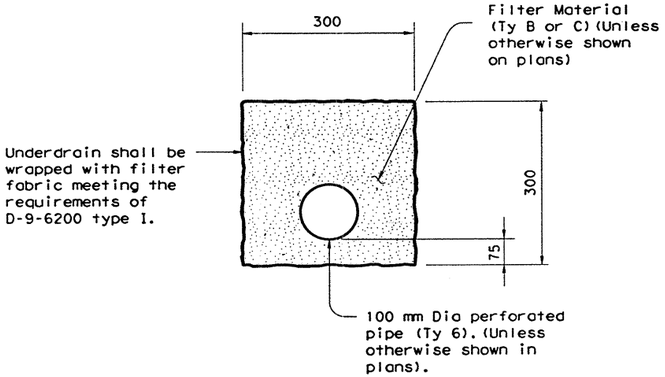
**SECTION**

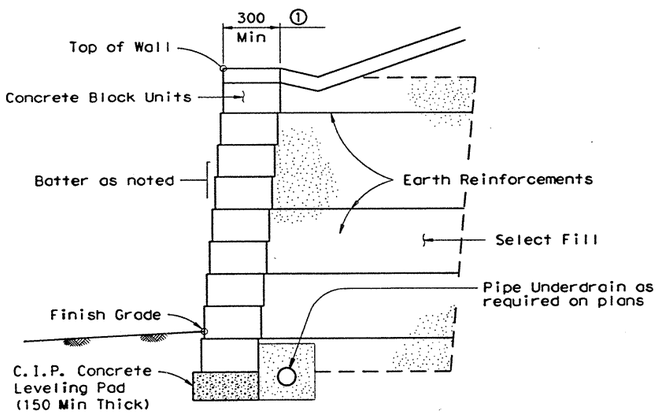
(No Earth Reinforcements)



**TYPICAL ELEVATION**



**UNDERDRAIN DETAIL**



**SECTION**

(With Earth Reinforcements)

① For systems utilizing continuous structural pins passing thru a minimum of 3 block layers, the minimum block depth shall be 200 mm. The maximum vertical spacing of primary reinforcement on these systems shall be 600 mm, and intermediate reinforcement will not be required.

② Unless noted elsewhere in the plans, 300 mm minimum cover shall be provided from the top of leveling pad to finish grade.

③ For walls which are designated as landscape walls and are less than 1,800 mm tall, the following modifications to the design criteria will be allowed:

Factor of safety in sliding > 1.2.
Factor of safety in overturning > 1.5.
Connection strength factor of safety of 1.0 at 20 mm strain.
Minimum earth reinforcement length of 1,200 mm.

The above modified criteria does not apply to walls over 1,800 mm tall regardless of designation.

EARTH REINFORCEMENTS:

Walls may be constructed without earth reinforcements if all stability criteria are met with the blocks alone. If all stability criteria are not satisfied, earth reinforcements shall be provided.

The long term design strength (LTDS) of earth reinforcement shall be calculated in accordance with AASHTO 1992 Standard and current Interim Specifications.

Soil-geogrid pullout coefficient values shall be determined in accordance with Geosynthetics Research Institute (GRI) Method GG-5, "Guidelines for Evaluating Geogrid Pullout".

For the combination of concrete block and geogrid chosen, connection strength data shall be provided. The allowable connection load shall be limited to the connection strength developed at 20 mm displacement, divided by a 1.5 safety factor. ③

For internal stability calculations, the failure plane will be assumed to originate at the back of the concrete blocks.

The factor of safety against pullout of the earth reinforcements shall be determined from test data evaluated at 20 mm strain.

The maximum vertical spacing of primary earth reinforcement layers shall be 1,000 mm. ①
The minimum length of primary earth reinforcements shall be 2,400 mm, measured from the front of the blocks. ③

A layer of intermediate reinforcement shall be provided between primary reinforcements when the spacing between primary layers exceeds twice the horizontal depth of the concrete block unit. Intermediate reinforcement shall have a minimum length of 1,200 mm, and shall provide local stability for the concrete block units. ①

STABILITY CRITERIA:

Factor of safety in sliding along the base of the structure shall be greater than or equal to 1.5. ③

Factor of safety in overturning shall be greater than or equal to 2.0. ③

The base pressure resultant shall fall within the middle third of the retaining wall.

DESIGN PARAMETERS:

Structure shall be based on the following design parameters:

Random Backfill: Unit weight = 18.8 kN/m³
(Embankment or Existing Soils) ø = 30° c = 0 kPa
Select Backfill: Unit weight = 18.8 kN/m³
ø = 34° c = 0 kPa

GENERAL NOTES:

Sections and Typical Elevation shown are for informational purposes only. Specific geometry is to be determined based on wall layouts and other plan information.

Unless otherwise shown in the plans, wall batter shall be a maximum of 250 mm per meter. Blocks shall be placed horizontally, and a positive means of obtaining batter such as pins, keyways, or concrete lips shall be provided.

All dimensions are in millimeters unless otherwise shown.

LOCATION: APPROX. 225 METERS DOWNSTREAM OF END OF STRUCTURE (AT HEC-2 STA 25900)

GENERAL NOTES:

1. ALL FREE SPAN BRIDGES AND BCS #2 AND #3 WERE HYDRAULICALLY ANALYZED AND DESIGNED USING THE BOSS RMS HEC-2 AND HEC-RAS COMPUTER SOFTWARE.
2. ALLOWABLE HW ELEV. 600 MM BELOW THE LOW CHORD ELEV. OF THE BRIDGE.
* 3. CULEBRA CREEK MAINLANE BRIDGES MODELED AS ONE BRIDGE
**4. DATA PRESENTED FOR CULEBRA CREEK FOR 50 YR. AND 100 YR. FLOODS ARE FOR ULTIMATE DEVELOPMENT BRIDGE DESIGNS WITH IMPROVED CHANNEL EXTENDING DOWNSTREAM FROM R.O.W. ULTIMATE CHANNEL IMPROVEMENTS DOWNSTREAM ARE NOT PART OF THIS PROJECT. BUT ARE CONSIDERED PART OF FUTURE IMPROVEMENT PROJECTS.
5. DATA PRESENTED FOR 25 YR. FLOOD FOR CULEBRA CREEK IS THE PROPOSED DESIGN FOR THIS PROJECT. ALL DATA SHOWN IS FOR THE 25 YR. FLOOD MODEL, UNLESS STATED OTHERWISE (SEE NOTE 4)

CHANGE ORDER NO. 34

| Reinforcing Steel | | | | Lbs. | 1222 |
| Concrete | | | | C.Y. | 11.16 |

Note: 20 bar diameter laps have been provided where required for the reinforcing steel lengths as given in the tables.

GENERAL NOTES:

DESIGN: Wingwall designed in accordance with Rankine's theory of retaining wall design.

Chamfer exposed corners ¾" unless specified otherwise.

All dimensions relating to reinforcing steel are to centers of bars.

The toewalls for wingwalls and culverts shall be omitted when structure is founded on solid rock.

CHANGE ORDER No. 37 ~~13~~

Change Order No. 10
Special Conc. Box Culvert
Design For Bridge Class
Culvert No. 3.

① 0" min to 5'-0" max. For T6 or C6 Rail, see T6-CM standard for additional details. For curbs without rail and greater than 1'-0" high, see ECD standard for additional details.

② Extend into slab.

③ Reinforcing shown for orientation purposes only. See table for number and spacing of bars.

④ For curbs less than 1'-0" high, tilt bars K or reduce bar height as necessary to maintain cover. For curbs less than 3" high, bars K may be omitted.

⑤ For vehicle safety, curb heights shall be reduced, if necessary, to provide a maximum 3" projection above finished grade. No changes will be made in quantities and no additional compensation will be allowed for this work.

⑥ Bar lengths over 60' include one bar lap as follows: #4 = 1'-9", #5 = 2'-2", #6 = 2'-7"& #8 = 4'-6"

## GENERAL NOTES:

Designed according to 1996 AASHTO Standard and Interim Specifications.
Designed for HS20 Loading and to the maximum fill height shown.
All reinforcing steel shall be Grade 60.
All concrete shall be Class "C" concrete with a minimum 28 day compressive strength of 3600 psi.
The bottom edge of the top slab shall be chamfered 3" at the entrance.
Reinforcing bars shall be adjusted to provide a minimum of 1 ¼" clear cover.
Construction joints shown at the flow line may be raised a maximum of 6" at the Contractor's option. If this option is used, Bars M may be cut off or raised, Bars C and D may be reversed, and Bars Y and Z may be reversed.
See standard MC-MD for skewed ends, angle sections and lengthening details.

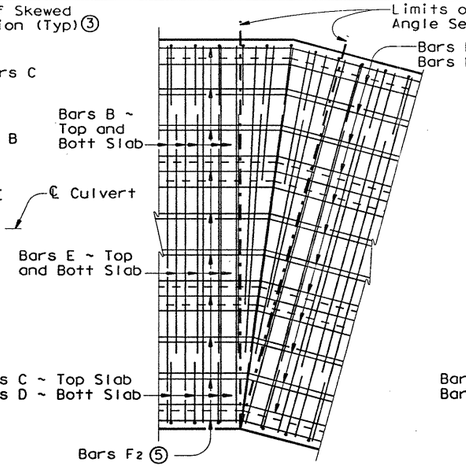
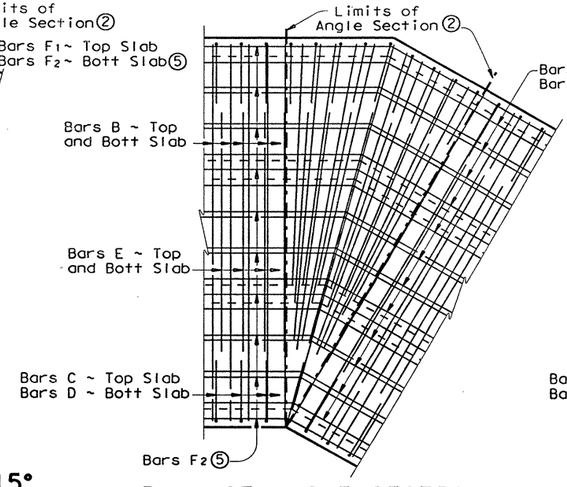
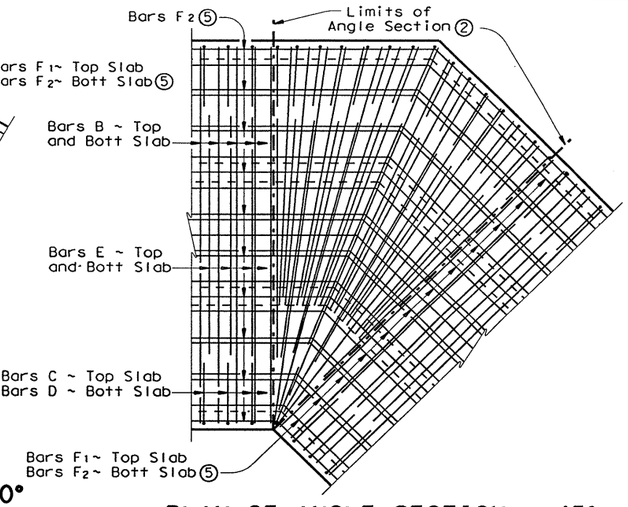
## PLAN OF SKEWED ENDS ~ 15° ⑦



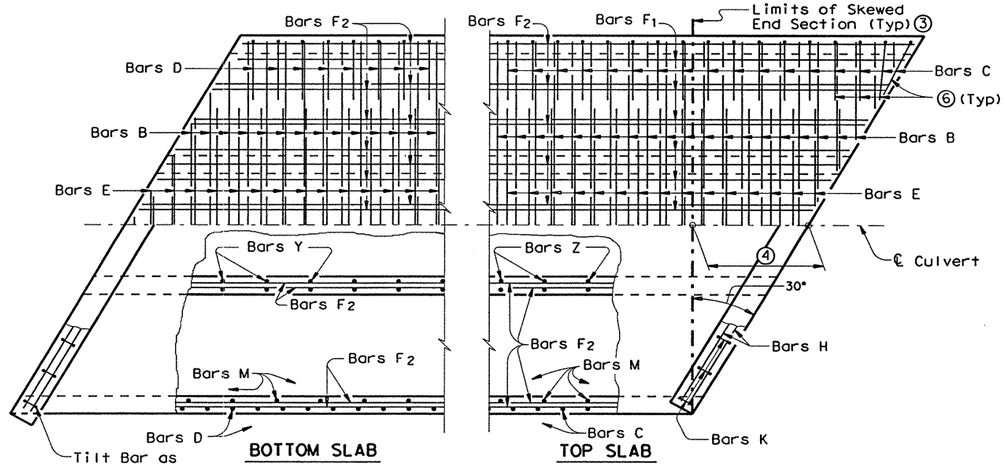
## PLAN OF ANGLE SECTION ~ 15°



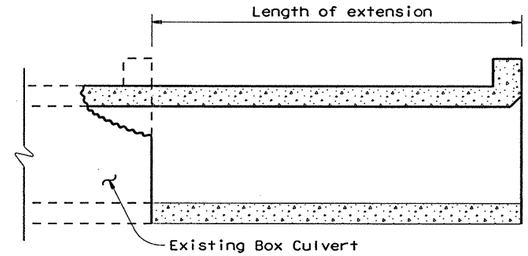
## PLAN OF ANGLE SECTION ~ 30°



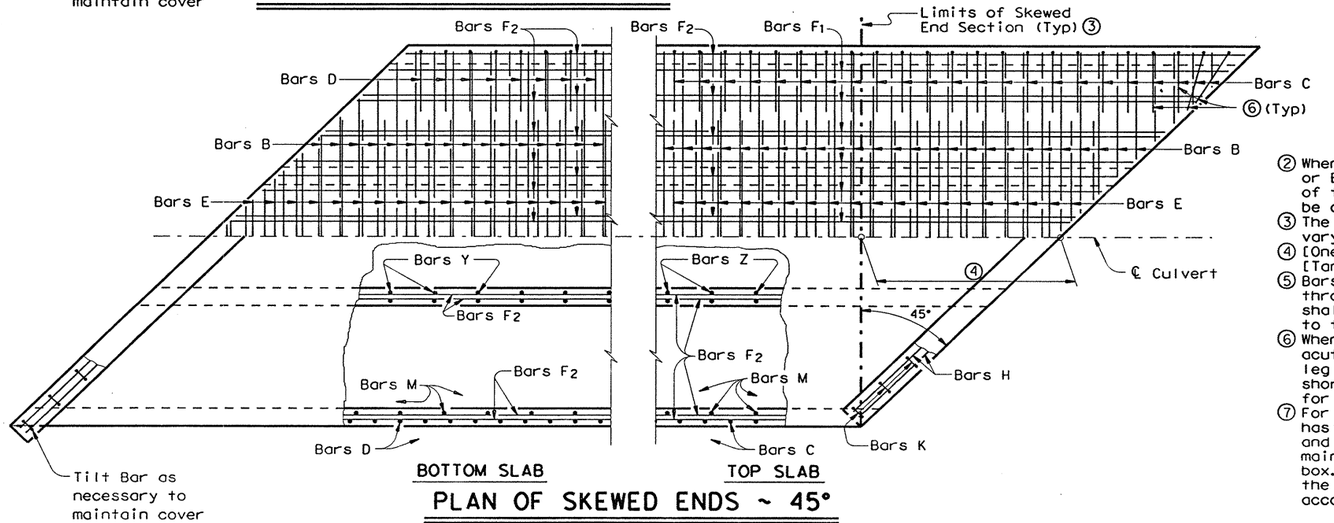
## PLAN OF ANGLE SECTION ~ 45°



## PLAN OF SKEWED ENDS ~ 30°



## LENGTHENING DETAIL ①



## PLAN OF SKEWED ENDS ~ 45°

① For box culverts with less than 2'-0" of fill, the top slab shall be broken back to provide a minimum 1'-10" lap of the existing longitudinal bars with the longitudinal bars in the extension. If the depth of fill is 2'-0" or greater, the top slab shall be broken back to provide a 1'-0" minimum embedment of existing longitudinal reinforcing into the extension. Alternatively, if the fill height is greater than 2'-0", the existing curb may be left in place and 2'-0" long #6 bars shall be drilled and grouted 1'-0" into the existing top slab at 1'-6" center to center spacing. Wings and apron shall be broken back as necessary to install the extension. Exposed wingwall and apron reinforcing may be removed or cleaned and included in the extension. When lengthening existing box culverts with dimensions different than current standard dimensions, horizontal and vertical transitions shall be formed as directed by the Engineer. Bottom slabs shall match to maintain an uninterrupted flow line. Existing and new reinforcing shall be field bent into transition maintaining specified cover requirements. For direct traffic culverts, the "H" dimension may be adjusted to provide a smooth riding surface.

② When the spacing between Bars B or Bars E becomes less than half of the normal spacing, bars shall be cut to avoid fouling

③ The length of Bars B and E will vary in the skewed end sections

④ [One half of overall width] x [Tan of the skew angle]

⑤ Bars $F_1$ and $F_2$ shall be continuous through the angle section. They shall be bent to remain parallel to the walls of the Box Culvert.

⑥ When necessary to avoid fouling in acute corners, the slab extension leg of Bars C and Bars D may be shortened to a minimum of 1'-6" for skews of 30° and 45°.

⑦ For skews of 15° or less, the contractor has the option of placing Bars B, C, D and E parallel to the skewed end while maintaining spacing along centerline box. Lengths of Bars B and E shown on the standards shall be increased to accommodate the skew.

### GENERAL NOTES:

Designed according to current AASHTO Standard and Interim Specifications.

Designed for HS20 loading.

All reinforcing steel shall be Grade 60.

All concrete shall be Class "C" concrete with a minimum 28 day compressive strength of 3600 psi; except for the top slab of direct traffic culverts, which shall be Class "S" concrete with a minimum 28 day compressive strength of 4000 psi.

Refer to Multiple Box Culverts Cast-in-Place standard for details of straight sections of culvert. For skewed sections and angle sections refer to Multiple Box Culverts Cast- in-Place standard for slab and wall dimensions, bar sizes, maximum bar spacing, and any other details not shown. For Skewed ends with curbs, adjust length of Bars H, number of Bars K, curb concrete volume and reinforcing steel weight by dividing the values shown on the culvert standards by the cosine of the skew angle.

Laps for Bars H, when required, shall be 1'-9" for uncoated bars and 2'-7" for epoxy coated.

* SUPPLIED FOR CONTRACTOR'S INFORMATION ONLY

## QUANTITIES THIS SHEET
## CSJ 2452-01-036

NOTES:
1.) ALL DIMENSIONS ARE IN METERS UNLESS NOTED OTHERWISE.
2.) CONTRACTOR TO REMOVE DOWNSTREAM HEADWALL OF EXISTING STRUCTURE, PLACE TEMPORARY CULVERT END-TO-END W/ EXISTING STRUCTURE, POUR CONCRETE AROUND TEMPORARY-TO-EXISTING STRUCTURE CONNECTION, AND BACKFILL W/ PROPOSED EMBANKMENT.
3.) UPON COMPLETION OF CULVERT #21 THE CONTRACTOR SHALL CAP BOTH ENDS OF THE TEMPORARY DRAINAGE STRUCTURE PLACED IN PHASE 2A AND 2B W/CONCRETE AND ABANDON AND REMOVE EXISTING DRAINAGE SRUCTURE IN PHASE 2B. THIS WORK SHALL NOT BE PAID FOR DIRECTLY BUT SHALL BE CONSIDERED SUBSIDIARY TO ITEM 464 (RC PIPE).
4.) CONTRACTOR TO PROVIDE POSITIVE DRAINAGE TO UPSTREAM END OF TEMPORARY DRAINAGE STRUCTURE AND AWAY FROM DOWNSTREAM END OF TEMPORARY DRAINAGE STRUCTURE.
5.) UPON COMPLETION OF THE ULTIMATE PROPOSED DRAINAGE STRUCTURE, SUFFICIENT LENGTH OF THE TEMPORARY DRAINAGE STRUCTURE SHALL BE REMOVED. LENGTH OF REMOVAL SHALL BE SUFFICIENT ENOUGH TO ALLOW FOR FINAL ROADWAY CONSTRUCTION AND GRADING AS APPROVED BY THE ENGINEER.
6.) FOR PAY ITEMS ASSOCIATED WITH STAGED CONST. OF CULVERT SEE CULVERT LAYOUT AND S.O.W. PLAN SHEETS.

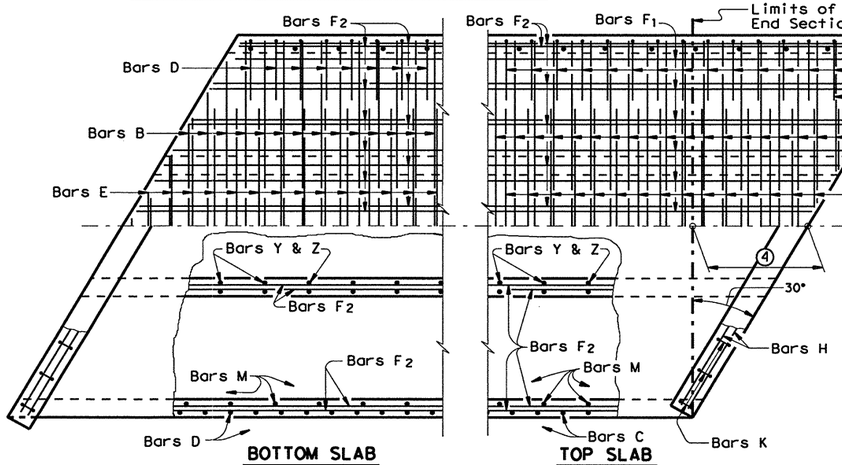
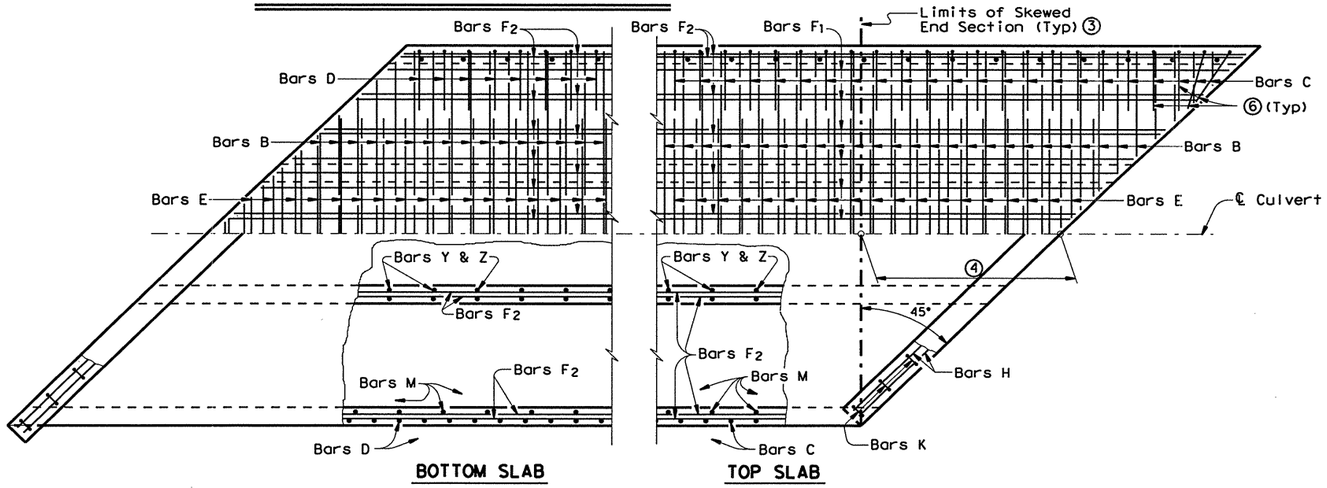
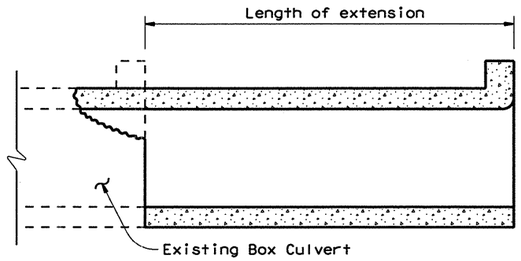
## PLAN OF ANGLE SECTION ~ 45°



## PLAN OF SKEWED ENDS ~ 30°



## PLAN OF SKEWED ENDS ~ 45°



## LENGTHENING DETAIL ①

① For box culverts with less than 0.6 m of fill, the top slab shall be broken back to provide a minimum 560 mm lap of the existing longitudinal bars with the longitudinal bars in the extension. If the depth of fill is 0.6 m or greater, the top slab shall be broken back to provide a 320 mm minimum embedment of existing longitudinal reinforcing into the extension. Alternatively, if the fill height is greater than 0.6 m, the existing curb may be left in place and 600 mm long #6 bars shall be drilled and grouted 300 mm into the existing top slab at 450 mm center to center spacing. Wings and apron shall be broken back as necessary to install the extension. Exposed wingwall and apron reinforcing may be removed or cleaned and included in the extension. When lengthening existing box culverts with dimensions different than current standard dimensions, horizontal and vertical transitions shall be formed as directed by the Engineer. Bottom slabs shall match to maintain an uninterrupted flow line. Existing and new reinforcing shall be field bent into transition maintaining specified cover requirements. For direct traffic culverts, the "H" dimension may be adjusted to provide a smooth riding surface.

② When the spacing between Bars B becomes less than half of the normal spacing, bars shall be cut to avoid fouling

③ The length of Bars B and E will vary in the skewed end sections

④ [One half of overall width] x [Tan of the skew angle]

⑤ Bars $F_1$ and $F_2$ shall be continuous through the angle section. They shall be bent to remain parallel to the walls of the Box Culvert.

⑥ When necessary to avoid fouling in acute corners, the slab extension leg of Bars C and Bars D may be shortened to a minimum of 450 mm for skews of 30° and 45°.

### GENERAL NOTES:

Designed according to current AASHTO Standard Specifications.

All reinforcing steel shall be Grade 420 (fy = 420 MPa).

All concrete shall have a minimum 28 day compressive strength of 25 MPa.

Refer to Multiple Box Culverts standard for details of straight sections of culvert. For skewed sections and angle sections refer to Multiple Box Culverts standard for slab and wall dimensions, bar sizes, maximum bar spacing, and any other details not shown.

③ The length of Bars B and E will vary in the skewed end sections

④ [One half of overall width] x [Tan of the skew angle]

⑤ Bars F1 and F2 shall be continuous through the angle section. They shall be bent to remain parallel to the walls of the Box Culvert.

⑥ When necessary to avoid fouling in acute corners, the slab extension leg of Bars C and Bars D may be shortened to a minimum of 1'-6" for skews of 30° and 45°.

⑦ For skews of 15° or less, the contractor has the option of placing Bars B, C, D and E parallel to the skewed end while maintaining spacing along centerline box. Lengths of Bars B and E shown on the standards shall be increased to accommodate the skew.

### GENERAL NOTES:

Designed according to current AASHTO Standard and Interim Specifications.

Designed for HS20 loading.

All reinforcing steel shall be Grade 60.

All concrete shall be Class "C" concrete with a minimum 28 day compressive strength of 3600 psi; except for the top slab of direct traffic culverts, which shall be Class "S" concrete with a minimum 28 day compressive strength of 4000 psi.

Refer to Multiple Box Culverts Cast-in-Place standard for details of straight sections of culvert. For skewed sections and angle sections refer to Multiple Box Culverts Cast- in-Place standard for slab and wall dimensions, bar sizes, maximum bar spacing, and any other details not shown. For Skewed ends with curbs, adjust length of Bars H, number of Bars K, curb concrete volume and reinforcing steel weight by dividing the values shown on the culvert standards by the cosine of the skew angle.

Laps for Bars H, when required, shall be 1'-9" for uncoated bars and 2'-7" for epoxy coated.

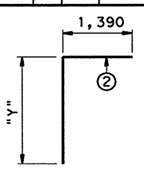
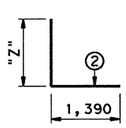
**BARS K ~ #4**
(Spa = 300 mm Max)
(Length = 1,290 mm)

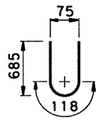


**BARS C**

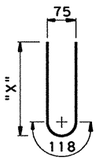
② Extend into slab.



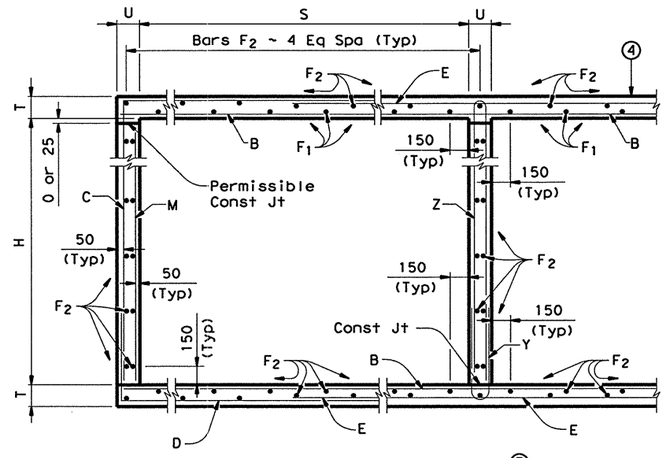
**BARS D**



**BARS Y**

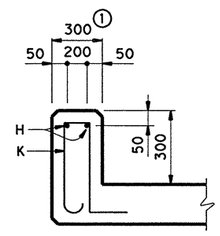


**BARS Z**



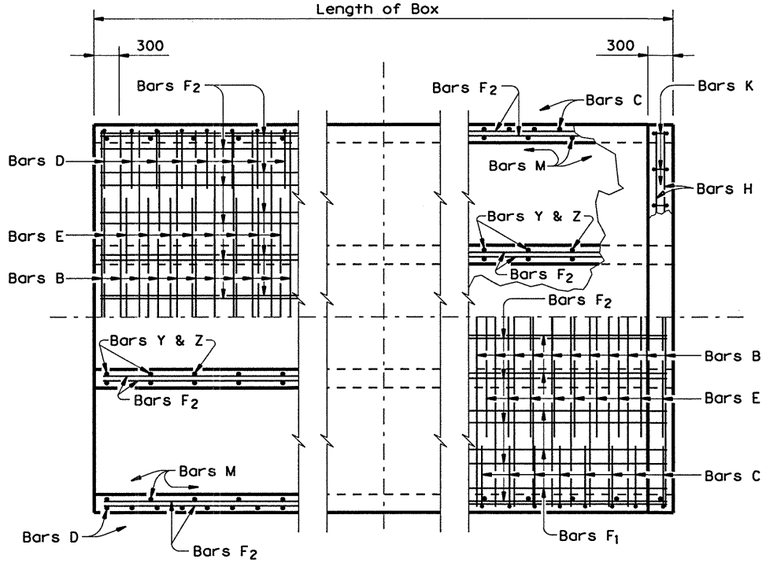
## TYPICAL SECTION ③

③ Reinforcing shown for orientation purposes only. See table for number and spacing of bars.



① For T6 Rail ~ see T6-CM(M) for additional details

## SECTION THRU CURB



**BOTTOM SLAB** **TOP SLAB**

## PART PLANS ③

④ For Direct Traffic, construct top slab to conform to crown of roadway while maintaining constant thickness of slab.

## GENERAL NOTES:

Designed according to current AASHTO 1992 Standard Specifications.

Designed for MS18 Loading and to the maximum fill height shown.

All reinforcing steel shall be Grade 420 (fy = 420 MPa).

All concrete shall have a minimum 28 day compressive strength of 25 MPa.

The bottom edge of the top slab shall be chamfered 75 mm at the entrance. Reinforcing bars shall be adjusted to provide a minimum of 35 mm clear cover. Headwall heights will be reduced, if necessary, to provide a minimum 75 mm projection above the roadway slope. No increase or decrease will be made in plan quantities of concrete or reinforcing steel for this work.

Construction joints shown at the flow line may be raised a maximum of 150 mm at the Contractor's option. If this option is used, bars M may be cut off or raised, bars C and D may be reversed, and Bars Y & Z may be reversed.

All dimensions are in millimeters and all mass is in kilograms unless otherwise noted.

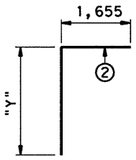
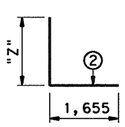
**BARS K ~ #4**
(Spa = 300 mm Max)
(Length = 1,290 mm)

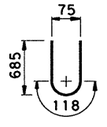


**BARS C**

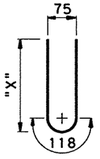
② Extend into slab.



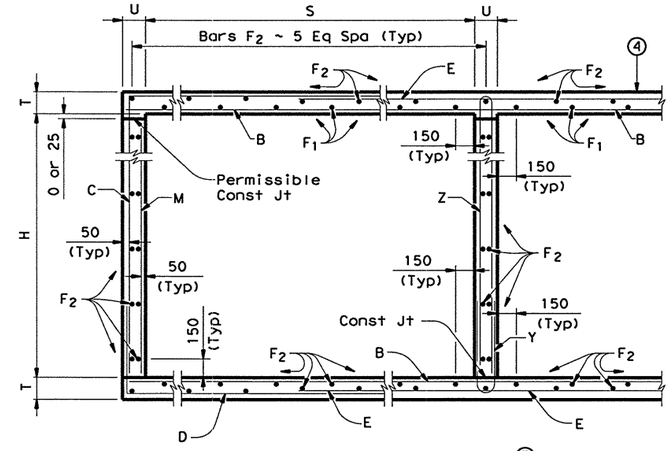
**BARS D**



**BARS Y**

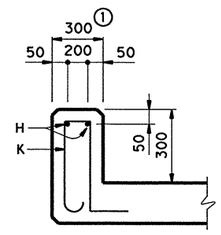


**BARS Z**



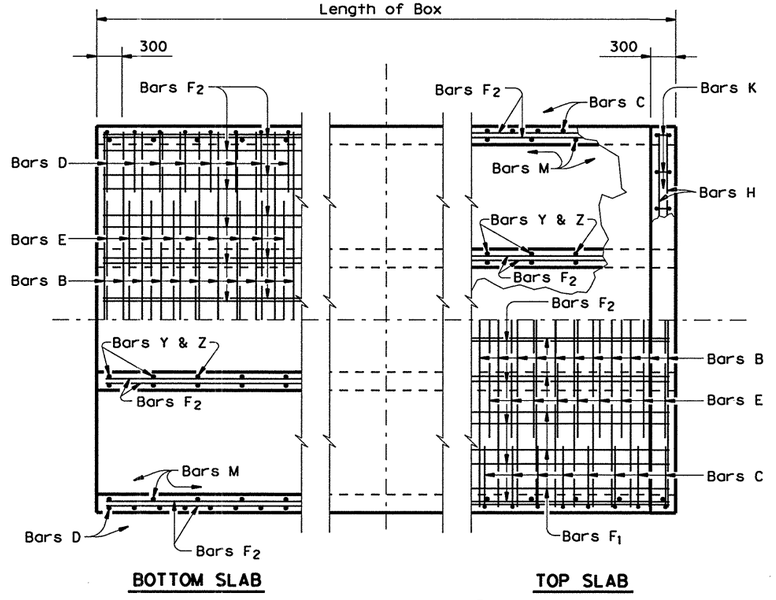
## TYPICAL SECTION ③

③ Reinforcing shown for orientation purposes only. See table for number and spacing of bars.



① For T6 Rail ~ see T6-CM(M) for additional details

## SECTION THRU CURB



## PART PLANS ③

④ For Direct Traffic, construct top slab to conform to crown of roadway while maintaining constant thickness of slab.

## GENERAL NOTES:

Designed according to current AASHTO 1992 Standard Specifications.

Designed for MS18 Loading and to the maximum fill height shown.

All reinforcing steel shall be Grade 420 (fy = 420 MPa).

All concrete shall have a minimum 28 day compressive strength of 25 MPa.

The bottom edge of the top slab shall be chamfered 75 mm at the entrance. Reinforcing bars shall be adjusted to provide a minimum of 35 mm clear cover. Headwall heights will be reduced, if necessary, to provide a minimum 75 mm projection above the roadway slope. No increase or decrease will be made in plan quantities of concrete or reinforcing steel for this work.

Construction joints shown at the flow line may be raised a maximum of 150 mm at the Contractor's option. If this option is used, bars M may be cut off or raised, bars C and D may be reversed, and Bars Y & Z may be reversed.

All dimensions are in millimeters and all mass is in kilograms unless otherwise noted.

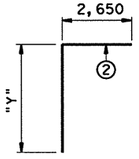
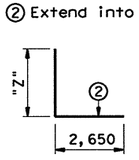
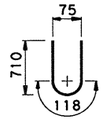
**BARS K ~ #4**
(Spa = 300 mm Max)
(Length = 1,290 mm)



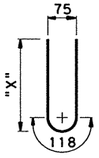
**BARS C**



**BARS D**

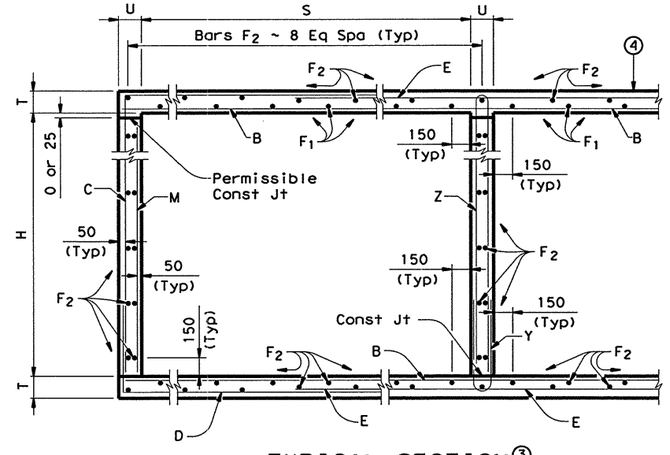


**BARS Y**



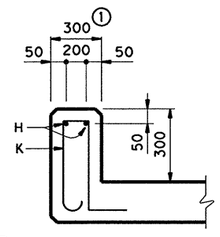
**BARS Z**

② Extend into slab.



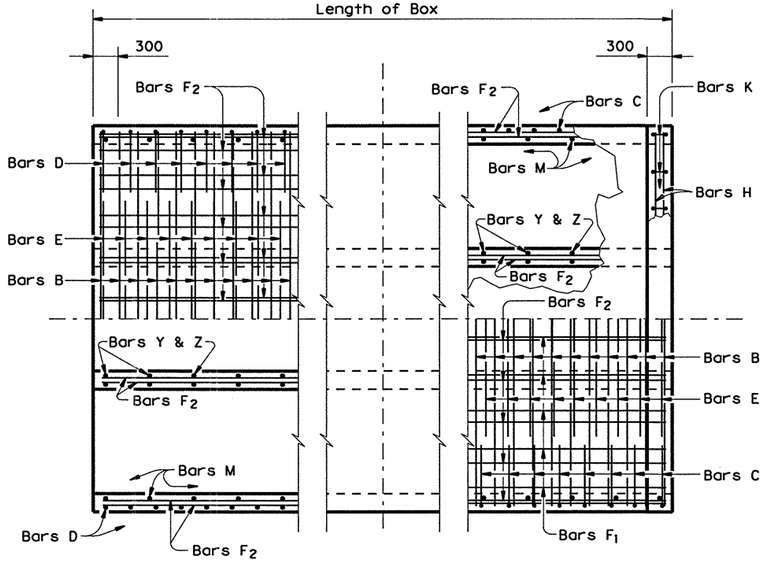
## TYPICAL SECTION ③

③ Reinforcing shown for orientation purposes only. See table for number and spacing of bars.



① For T6 Rail ~ see T6-CM(M) for additional details

## SECTION THRU CURB



**BOTTOM SLAB** **TOP SLAB**

## PART PLANS ③

④ For Direct Traffic, construct top slab to conform to crown of roadway while maintaining constant thickness of slab.

## GENERAL NOTES:

Designed according to current AASHTO 1992 Standard Specifications.

Designed for MS18 Loading and to the maximum fill height shown.

All reinforcing steel shall be Grade 420 (fy = 420 MPa).

All concrete shall have a minimum 28 day compressive strength of 25 MPa.

The bottom edge of the top slab shall be chamfered 75 mm at the entrance. Reinforcing bars shall be adjusted to provide a minimum of 35 mm clear cover. Headwall heights will be reduced, if necessary, to provide a minimum 75 mm projection above the roadway slope. No increase or decrease will be made in plan quantities of concrete or reinforcing steel for this work.

Construction joints shown at the flow line may be raised a maximum of 150 mm at the Contractor's option. If this option is used, bars M may be cut off or raised, bars C and D may be reversed, and Bars Y & Z may be reversed.

All dimensions are in millimeters and all mass is in kilograms unless otherwise noted.

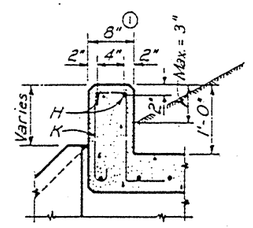
* These quantities do not include toe walls or wings.



SECTION THRU CURB

GENERAL NOTES:

Designed for HS 20 Loading and maximum fill heights shown.

The bottom edge of the top slab shall be chamfered 3 inches at the entrance. Reinforcing bars shall be adjusted to provide a minimum of 1¼ inches clear cover. Headwall heights will be reduced, if necessary, to provide a maximum of 3 inches projection above the roadway slope. No increase or decrease will be made in plan quantities of concrete or reinforcing steel for this work.

Construction joints shown at the flow line may be raised a maximum of 6 inches at the Contractor's option. Bars M may be cut off or raised, bars C and D may be reversed (D on top) and bars Y and Z may be reversed (Y on top).

All reinforcing steel shall be Grade 60.

① Width must be increased by 4" for use with T6 Rail. (See T6-CM Rail Standard)

Length of Bars Y shall be 4" more than toewall length. One 30 diam. lap included for all bars Y over 40'-0" in length. Two 30 diam. laps for all bars Y over 80'-0" in length.

M = Length of Toewall = 1.4142 [n(S+T2) + T2] - (K1+K2)
n = Number of Spans
S = Normal Clear Span.
Example: 6 Spans of 7'x5'
M = 1.4142 [6(7+0.58+0.58] - (1.63+3.27) = 60'-2 7/8

GENERAL NOTES:
DESIGN: Wingwall designed in accordance with Rankine's theory of retaining wall design.

Chamfer exposed corners 3/4" unless specified otherwise.

All dimensions relating to reinforcing steel are to center of bars.

The toewalls for wingwalls and culverts shall be omitted when structure is founded on solid rock.

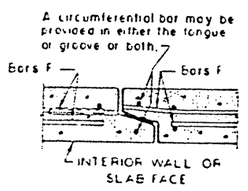
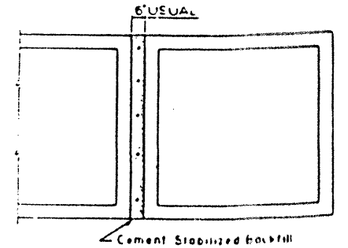
SINGLE MAT PLACEMENT

DOUBLE MAT PLACEMENT

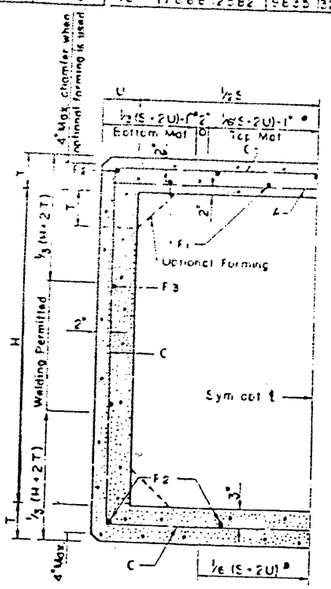


STEEL SUPPORT DETAIL

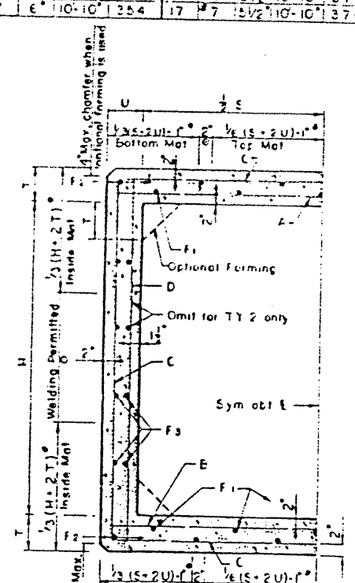
NOTE: As many Bars F as necessary may be extended to end of box to support steel during manufacture. Bars may be slightly bent to clear slope on groove tip as shown in detail. Alternatively the steel may be supported by bar extensions welded to Bars F.



MULTIPLE UNIT PLACEMENT



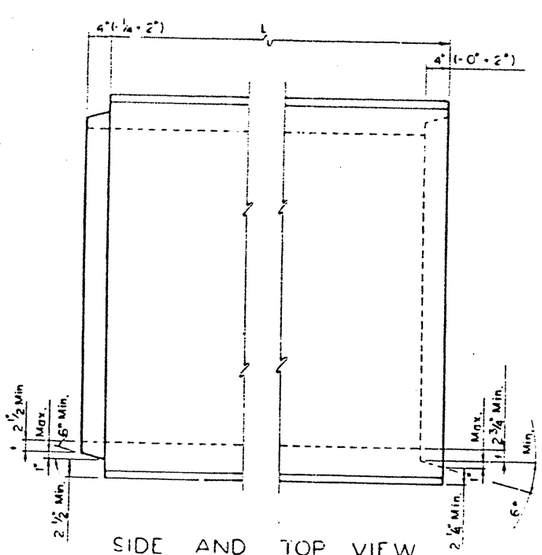
HALF SECTION TYPE 1



HALF SECTION TYPES 2 & 3

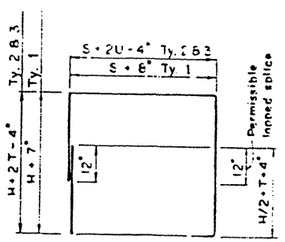
* These dimensions shall be sufficiently different to allow a ¼ (± ⅛") nominal space between the sloping faces.

* Permissible tack welding on mats shown.
© Permissible tack welding both mats.



SIDE AND TOP VIEW

NOTE Tongue and groove dimensional controls shown are intended to allow either a 4" long 1:1 slope joint, a 6" long 6" slope joint or any joint configuration within these limits. Dimensions shown as minimums shall be maintained around the perimeter of the box



BARS C

GENERAL NOTES

Cement Stabilized Backfill shall be considered subsidiary to the unit price bid for Concrete Box

All welding to be done by qualified welder

Cross sectional area of gasket material shall not be less than 3.25 sq. in.

Additional splices in reinforcing steel not shown hereon, must be submitted to the Bridge Division for approval prior to fabrication

Grade 60 bars or wire fabric may be used in place of Grade 40 steel by supplying 67 % of the area of steel per linear foot shown in the Tables for bars A, B, C and D

Longitudinal steel shall have at least as much area as Bars F and shall be spaced at 18" C.C. maximum

These designs are adequate for HS 20 live loading and any fill from 2'-0" to the maximum shown in the tables

In lieu of furnishing the designs shown on this detail the contractor may use designs from either Std. PC-4, PC-7 or ASTM C-789, Table 1. In either case, the substituted design must equal or exceed the maximum fill height for the same sized box in the table on this detail. For boxes reinforced with wire fabric the minimum cover shall be three times the wire diameter but not less than one inch. Placing of reinforcement shall otherwise conform to specification "Reinforcing Steel"

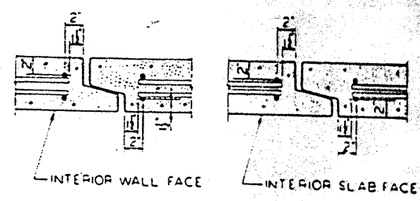
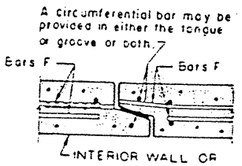
SINGLE MAT PLACEMENT

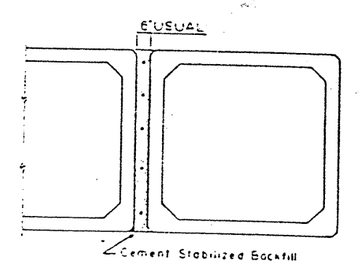


DOUBLE MAT PLACEMENT

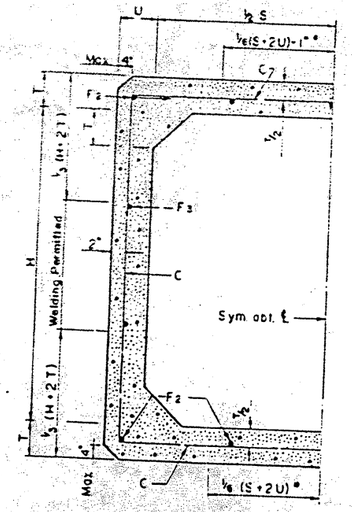


STEEL SUPPORT DETAIL

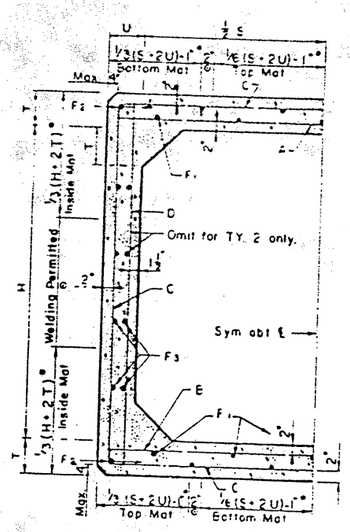
NOTE: As many Bars F as necessary may be extended to end of box to support steel during manufacture. Bars may be slightly bent to clear slope on groove lip as shown in detail. Alternatively the steel may be supported by bar extensions welded to Bars F.



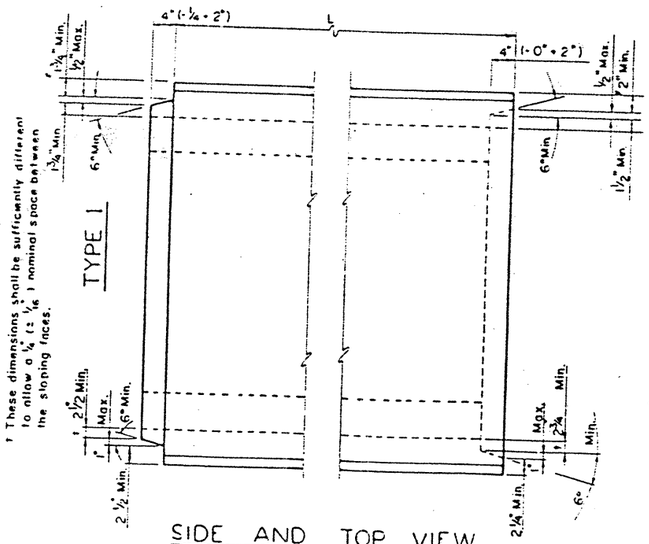
MULTIPLE UNIT PLACEMENT



HALF SECTION TYPE 1

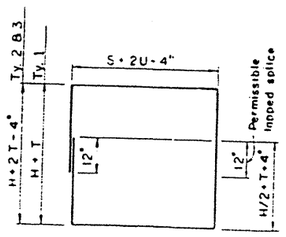


HALF SECTION TYPES 2 & 3



SIDE AND TOP VIEW

NOTE. Tongue and groove dimensional controls shown are intended to allow either a 4" long 1° slope joint, a 6" long 6° slope joint or any joint configuration within these limits. Dimensions shown as minimums shall be maintained around the perimeter of the box



BARS C

GENERAL NOTES:

Cement Stabilized Backfill shall be subsidiary to the unit price bid for Concrete Box.

All welding to be done by qualified welder

Additional splices in reinforcing steel not shown hereon, must be submitted to the Bridge Division for approval prior to fabrication.

Grade 60 Bars or Wire Fabric may be used in place of Grade 40 Steel by supplying 67% of the area of steel per linear foot shown in the Tables for Bars A, B, C and D.

Longitudinal shall have at least as much area as Bars F and shall be spaced at 18" c.c. maximum.

These designs are adequate for HS 20 live loading and any fill from 2'-0" to the maximum shown in the tables

In lieu of furnishing the designs shown on this detail the contractor may use designs from either Std. PC-2, PC-7 or ASTM C-789, Table I. In either case, △ the substituted design must equal or exceed the maximum fill height for the same sized box in the table on this detail. For boxes reinforced with wire fabric the minimum cover shall be three times the wire diameter but not less than one inch. Placing of reinforcement shall otherwise conform to the specification "Reinforcing Steel"

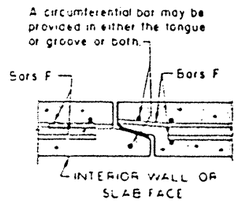
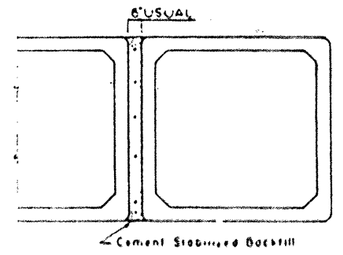
SINGLE MAT PLACEMENT

DOUBLE MAT PLACEMENT

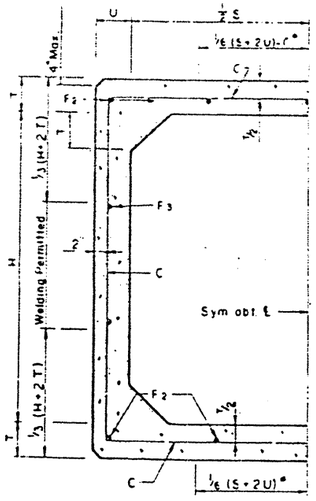


STEEL SUPPORT DETAIL

NOTE: As many Bars F as necessary may be extended to end of box to support steel during manufacture. Bars may be slightly bent to clear slope or groove lip as shown in detail. Alternatively the steel may be supported by bar extensions welded to Bars F

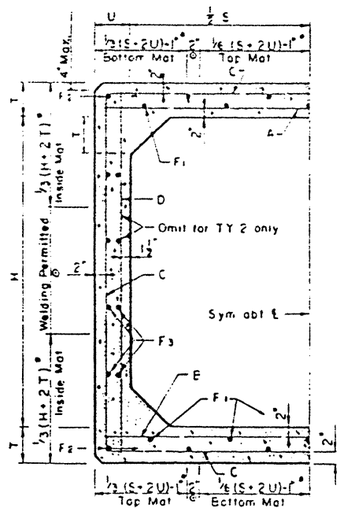


MULTIPLE UNIT PLACEMENT



HALF SECTION

TYPE 1



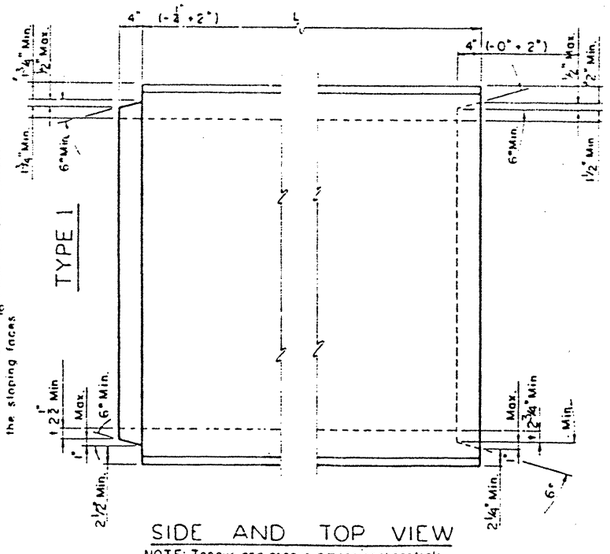
HALF SECTION

TYPES 2 & 3

* Permissible tack welding on mats shown

© Permissible tack welding both mats

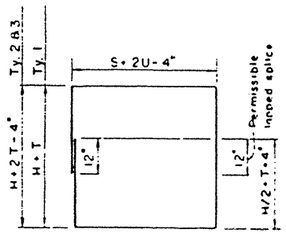
* These dimensions shall be sufficiently different to allow a ¼" (± 1/16") nominal space between the sloping faces.



SIDE AND TOP VIEW

NOTE: Tongue and groove dimensional controls shown are intended to allow either a 4" long 1" slope joint, a 6" long 6" slope joint or any joint configuration within these limits. Dimensions shown as minimums shall be maintained around the perimeter of the box.

TYPE 2 & 3



BARS C

GENERAL NOTES

Cement Stabilized Backfill shall be considered subsidiary to the unit price bid for Concrete Box

All welding to be done by qualified welder

Additional splices in reinforcing steel not shown hereon, must be submitted to the Bridge Division for approval prior to fabrication.

Grade 60 Bars or Wire Fabric may be used in place of Grade 40 Steel by supplying 82 % of the area of steel per linear foot shown in the Tables for Bars A.

Longitudinal steel shall have at least as much area as Bars F and shall be spaced at 18" c.c. maximum.

These designs are adequate for HS 20 live loading and any fill from 2'-0" to the maximum shown in the tables.

In lieu of furnishing the designs shown on the detail the contractor may use designs from ASTM C-789, Table 1. In either case, the substituted design must equal or exceed the maximum fill height for the same sized bar in the table on this detail. For boxes reinforced with wire fabric the minimum cover shall be three times the wire diameter but not less than one inch. Placing of reinforcement shall otherwise conform to specification "Reinforcing Steel".

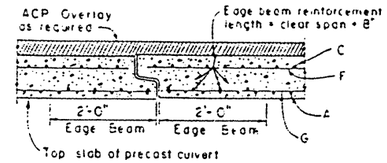
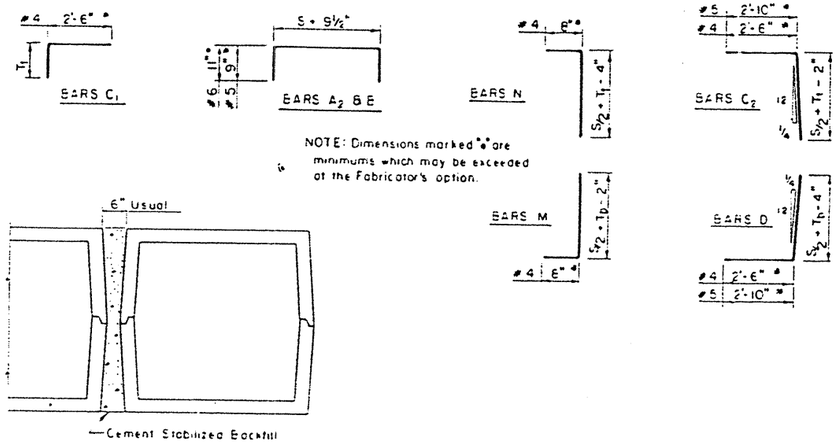
* Lift weight is the maximum piece weight of the top and bottom sections.

† If the fill height is greater than 2'-0", the size and spacing of Bars G may be reduced to that of Bars F.

NOTE: Edge beam reinforcement may be combined with Bars A in a single layer, or placed in a separate layer as shown below. Bars shall be bundled as necessary to maintain required clear distances between bars.



EDGE BEAM



NOTE: Dimensions marked "*" are minimums which may be exceeded at the Fabricator's option.

MULTIPLE UNIT PLACEMENT

GENERAL NOTES:

Design conforms to IS77 AASHTO Standard Specifications for Highway Bridges (Interim revisions included thru 1982) for HS 20 direct traffic loading and maximum fill height shown in the table. Precast culverts constructed according to this design shall conform to Item 462 "Concrete Box Culverts."

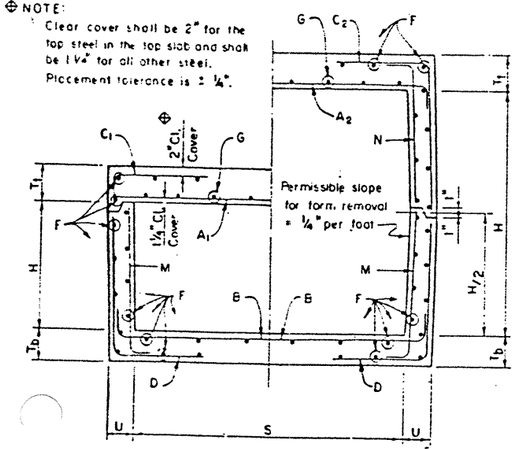
The Contractor may furnish designs shown on this sheet in lieu of other precast culvert designs of the same nominal size, provided the maximum fill does not exceed that shown in the table.

Reinforcing steel: Grade 60 deformed bars. Concrete, $f'_c$ = 4000psi.

Joint Protection: Where fill measured from the top of the precast box culvert to the roadway surface is less than 2'-0", joints shall be protected by strengthening the top slab with an Edge Beam at each free edge.

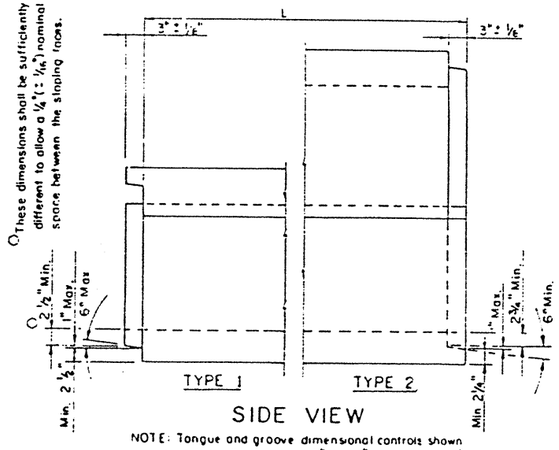
Edge Beams shall be subsidiary to the unit price bid for Concrete Box.

⊕ NOTE:
Clear cover shall be 2" for the top steel in the top slab and shall be 1¼" for all other steel.
Placement tolerance is ± ¼".



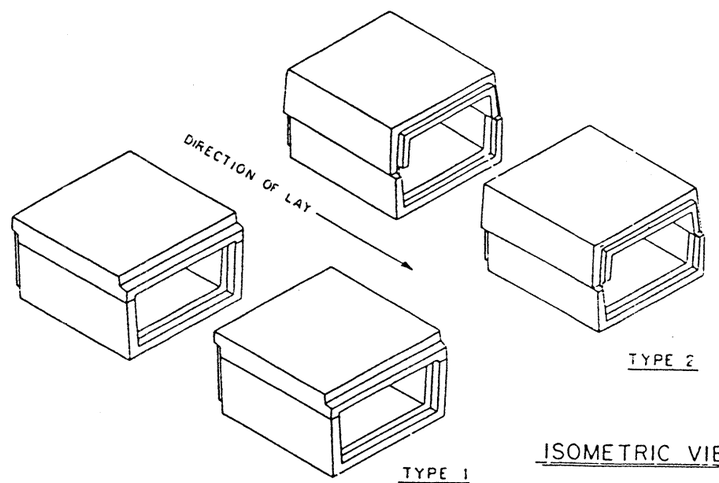
TYPE 1 TYPE 2

TYPICAL BOX HALF SECTIONS



SIDE VIEW

NOTE: Tongue and groove dimensional controls shown are intended to allow either a 3" long 1" slope joint, a 3" long 6" slope joint or any joint configuration within these limits. Dimensions shown as minimums shall be maintained around the box and along the horizontal joint.



ISOMETRIC VIEW

Tack Welding: No tack welding of reinforcing bars will be permitted except within 6 inches of an end. Bars F are exempt from this restriction, and may be tack welded anywhere along their length.

Multiple Unit Placement: Cement Stabilized Backfill shall be considered subsidiary to the unit price bid for Concrete Box.

Form Removal and Handling Procedures: Precast pieces may be removed from the forms as soon as they have attained sufficient strength to allow handling without cracking. Damaged or cracked pieces shall be subject to rejection.

Marking: In addition to the marking requirements of Item 462, each piece shall bear the following markings:

Top and Bottom pieces without edge beams: T X PC 7

Top pieces with edge beams: T X PC 7 E B

Joint Seals: Horizontal and transverse joints shall be sealed in accordance with the Specifications.

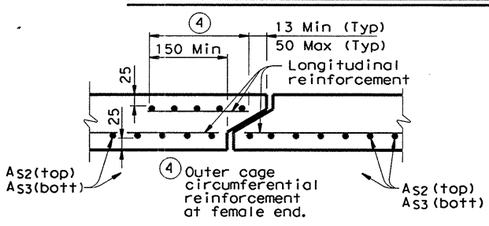
## ASTM C850M STANDARD



## SECTION A-A

(TOP AND BOTTOM SLAB JOINT REINFORCEMENT)

**GENERAL NOTES:**

Designs shown conform to ASTM C789M or ASTM C850M. Refer to ASTM C789M or ASTM C850M for information or details not shown.

For ASTM C789M designs, all reinforcing steel shall have a minimum specified yield stress of 445 MPa.

For ASTM C850M designs, all reinforcing steel shall have a minimum specified yield stress of 414 MPa.

All box concrete shall have a minimum 28 day compressive strength of 35 MPa.

See SCP-MD(M) standard sheet for miscellaneous details and notes not shown.

Designed for MS18 (HS20) loading and fill heights shown.

In lieu of furnishing the designs shown on this sheet, the contractor may furnish an alternate design that is equal to or exceeds the box design for the design fill height in the table. Shop plans for alternate designs shall be submitted in accordance with Item "Precast Concrete Structures".

All dimensions in millimeters unless otherwise shown.

## GENERAL NOTES:

Designed according to current AASHTO 1992 Standard Specifications.

Designed for MS18 Loading and to the maximum fill height shown.

All reinforcing steel shall be Grade 420 (fy = 420 MPa).

All concrete shall have a minimum 28 day compressive strength of 25 MPa.

The bottom edge of the top slab shall be chamfered 75 mm at the entrance. Reinforcing bars shall be adjusted to provide a minimum of 35 mm clear cover. Headwall heights will be reduced, if necessary, to provide a minimum 75 mm projection above the roadway slope. No increase or decrease will be made in plan quantities of concrete or reinforcing steel for this work.

Construction joints shown at the flow line may be raised a maximum of 150 mm at the Contractor's option. If this option is used, bars M may be cut off or raised, bars C and D may be reversed, and Bars Y & Z may be reversed.

All dimensions are in millimeters and all mass is in kilograms unless otherwise noted.

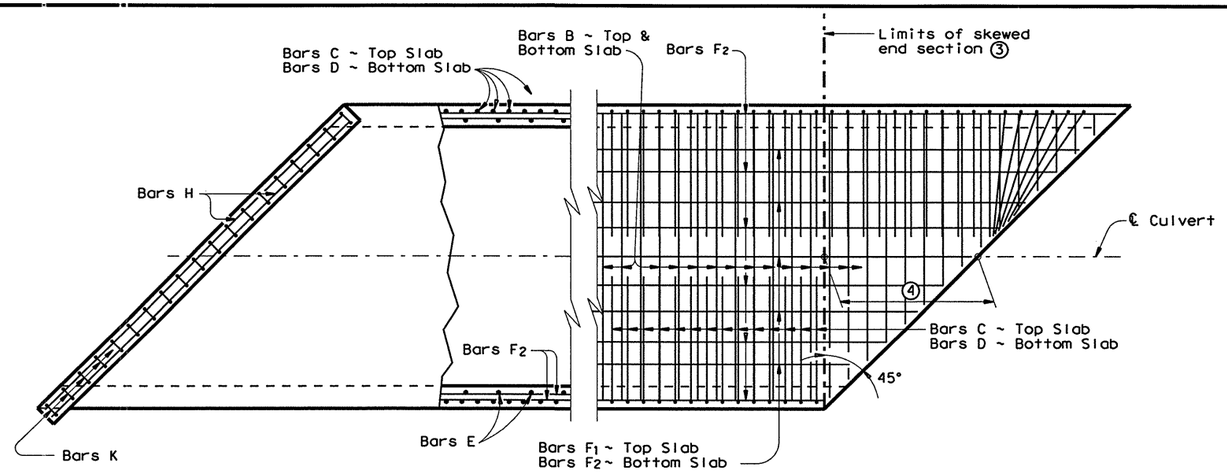
WALLS AND CURB SLAB

## PLAN OF SKEWED ENDS ~ 15°



WALLS AND CURB SLAB

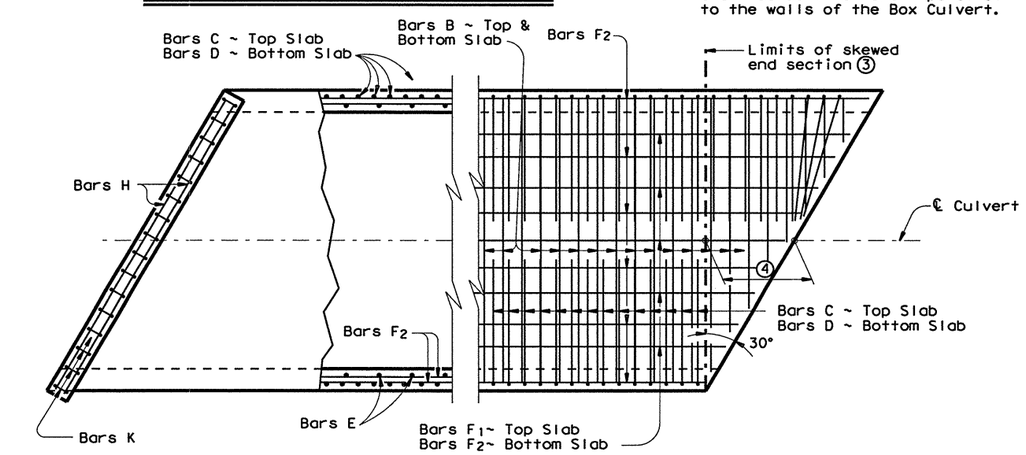
## PLAN OF SKEWED ENDS ~ 45°

② When the spacing between Bars B becomes less than half of the normal spacing, bars shall be cut to avoid fouling

③ The length of Bars B and E will vary in the skewed end sections

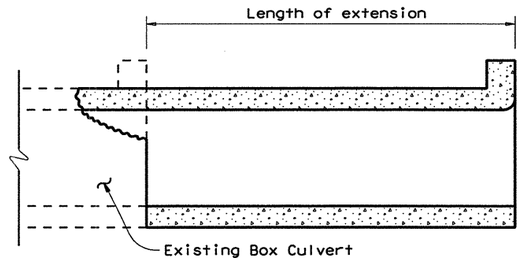
④ [One half of overall width] x [Tan of the skew angle]

⑤ Bars $F_1$ and $F_2$ shall be continuous through the angle section. They shall be bent to remain parallel to the walls of the Box Culvert.



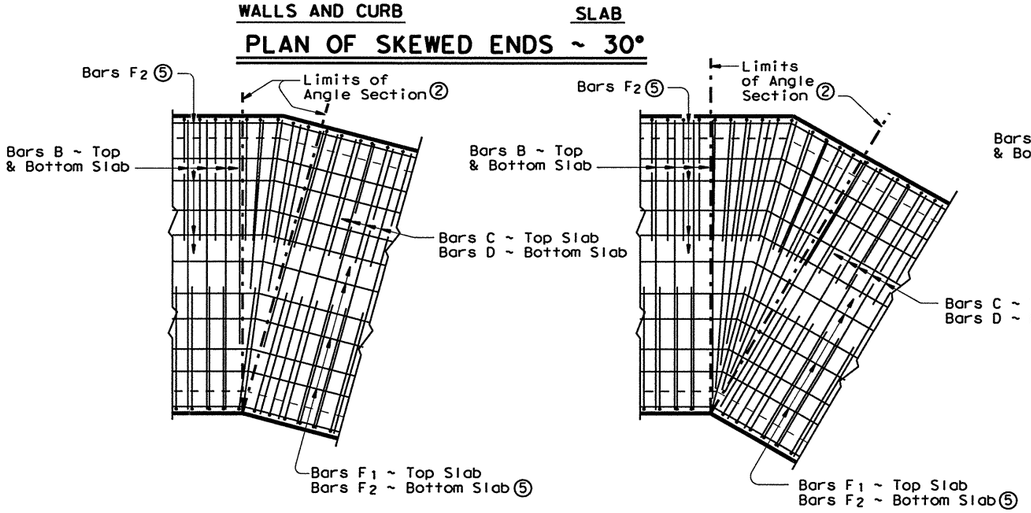
WALLS AND CURB SLAB

## PLAN OF SKEWED ENDS ~ 30°



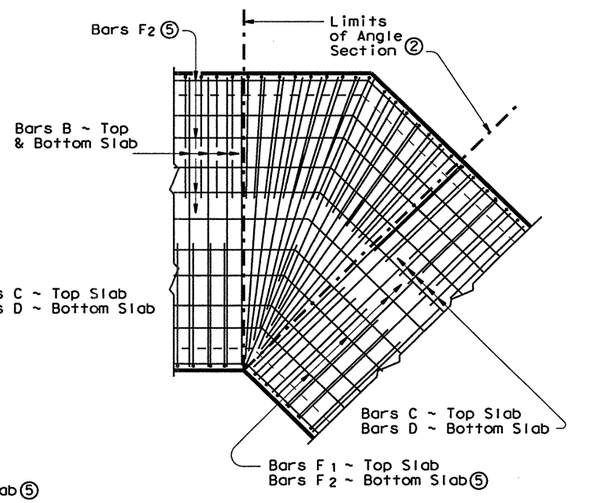
## LENGTHENING DETAIL ①

① For box culverts with less than 0.6 m of fill, the top slab shall be broken back to provide a minimum 560 mm lap of the existing longitudinal bars with the longitudinal bars in the extension. If the depth of fill is 0.6 m or greater, the top slab shall be broken back to provide a 320 mm minimum embedment of existing longitudinal reinforcing into the extension. Alternatively, if the fill height is greater than 0.6 m, the existing curb may be left in place and 600 mm long #6 bars shall be drilled and grouted 300 mm into the existing top slab at 450 mm center to center spacing. Wings and apron shall be broken back as necessary to install the extension. Exposed wingwall and apron reinforcing may be removed or cleaned and included in the extension. When lengthening existing box culverts with dimensions different than current standard dimensions, horizontal and vertical transitions shall be formed as directed by the Engineer. Bottom slabs shall match to maintain an uninterrupted flow line. Existing and new reinforcing shall be field bent into transition maintaining specified cover requirements. For direct traffic culverts, the "H" dimension may be adjusted to provide a smooth riding surface.



## PLAN OF ANGLE SECTION ~ 15°

## PLAN OF ANGLE SECTION ~ 30°



## PLAN OF ANGLE SECTION ~ 45°

### GENERAL NOTES:

Designed according to current AASHTO Standard Specifications.

All reinforcing steel shall be Grade 420 (fy = 420 MPa).

All concrete shall have a minimum 28 day compressive strength of 25 MPa.

Refer to Single Box Culverts Cast-in-Place standard for details of straight sections of culvert. For skewed sections and angle sections refer to Single Box Culverts Cast-in-Place standard for slab and wall dimensions, bar sizes, maximum bar spacing, and any other details not shown.

② Minimum fill height shown shall be used for direct traffic loading.

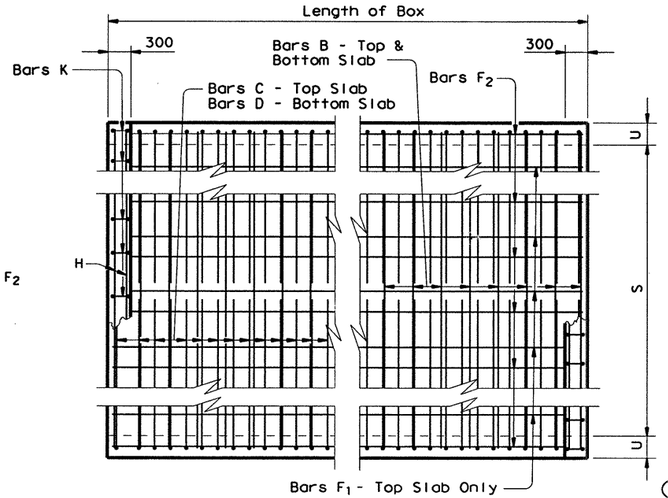
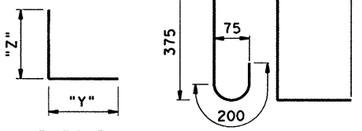
## TYPICAL SECTION

For Direct Traffic, construct slab to conform to crown of roadway while maintaining constant thickness of slab.

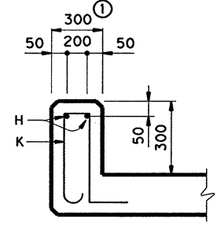


## PLAN OF REINF STEEL



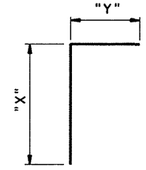
BARS D

BARS K ~ #4
(Spa = 300 mm Max)
(Length = 1290 mm)



① For T6 Rail ~ see T6-CM(M) for additional details

## SECTION THRU CURB



BARS C

## GENERAL NOTES:

Designed according to current AASHTO Standard Specifications.
Designed for MS18 Loading and to the maximum fill height shown.
All reinforcing steel shall be Grade 420 (fy = 420 MPa).
All concrete shall have a minimum 28 day compressive strength of 25 MPa.
The bottom edge of the top slab shall be chamfered 75 mm at the entrance. Reinforcing bars shall be adjusted to provide a minimum of 35 mm clear cover. Headwall heights will be reduced, if necessary, to provide a maximum 75 mm projection above the roadway slope. No increase or decrease will be made in plan quantities of concrete or reinforcing steel for this work.
Construction joints shown at the flow line may be raised a maximum of 150 mm at the Contractor's option. If this option is used, bars E may be cut off or raised, and bars C and D may be reversed.
All dimensions are in millimeters and all mass is in kilograms unless otherwise noted.

**CHANGE ORDER NO. 56**

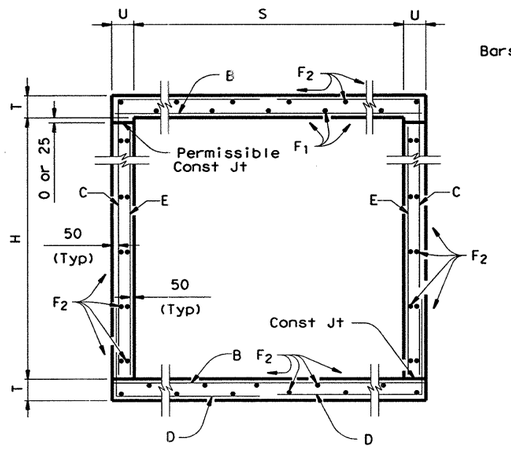
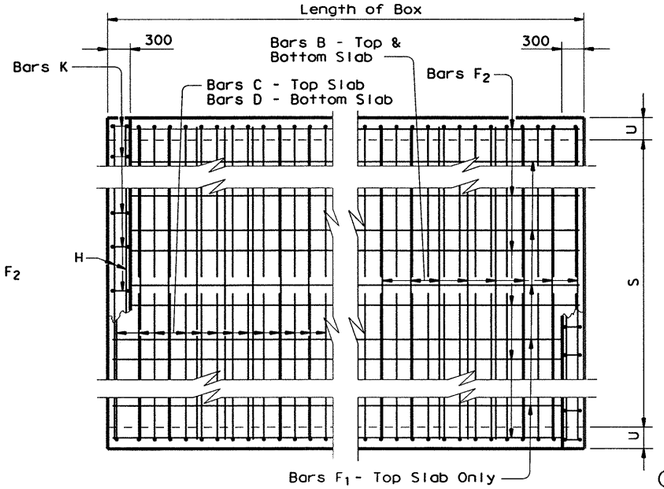
② Minimum fill height shown shall be used for direct traffic loading.

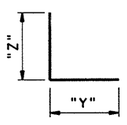


TYPICAL SECTION

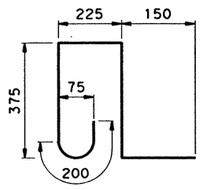
For Direct Traffic, construct slab to conform to crown of roadway while maintaining constant thickness of slab.



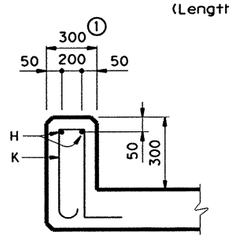
PLAN OF REINF STEEL



BARS D

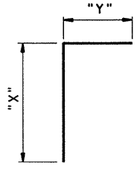


BARS K ~ #4
(Spa = 300 mm Max)
(Length = 1290 mm)



① For T6 Rail ~ see T6-CM(M) for additional details

SECTION THRU CURB



BARS C

**GENERAL NOTES:**

Designed according to current AASHTO Standard Specifications.
Designed for MS18 Loading and to the maximum fill height shown.
All reinforcing steel shall be Grade 420 (fy = 420 MPa).
All concrete shall have a minimum 28 day compressive strength of 25 MPa.
The bottom edge of the top slab shall be chamfered 75 mm at the entrance. Reinforcing bars shall be adjusted to provide a minimum of 35 mm clear cover. Headwall heights will be reduced, if necessary, to provide a maximum 75 mm projection above the roadway slope. No increase or decrease will be made in plan quantities of concrete or reinforcing steel for this work.
Construction joints shown at the flow line may be raised a maximum of 150 mm at the Contractor's option. If this option is used, bars E may be cut off or raised, and bars C and D may be reversed.
All dimensions are in millimeters and all mass is in kilograms unless otherwise noted.

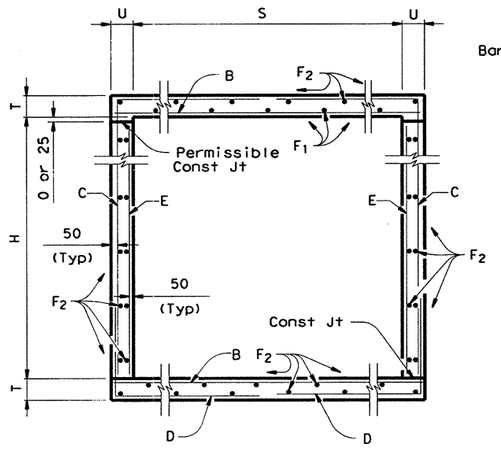
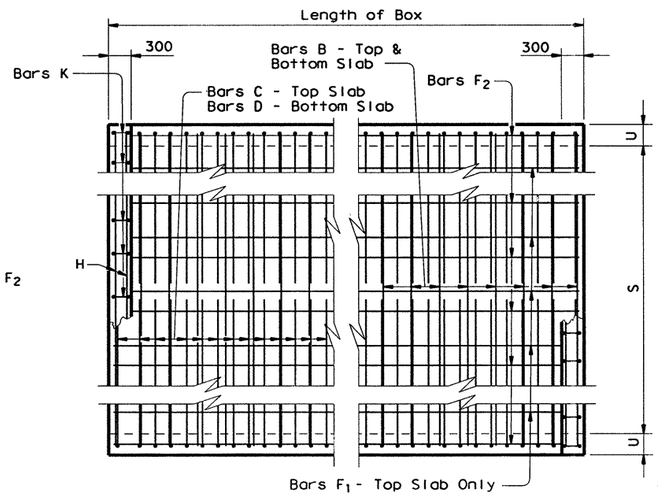
② Minimum fill height shown shall be used for direct traffic loading.

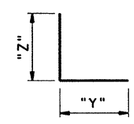


TYPICAL SECTION

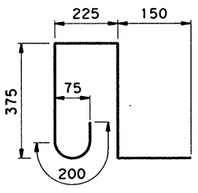
For Direct Traffic, construct slab to conform to crown of roadway while maintaining constant thickness of slab.



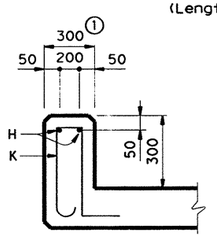
PLAN OF REINF STEEL



BARS D

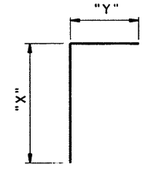


BARS K ~ #4
(Spa = 300 mm Max)
(Length = 1290 mm)



① For T6 Rail ~ see T6-CM(M) for additional details

SECTION THRU CURB



BARS C

**GENERAL NOTES:**

Designed according to current AASHTO Standard Specifications.
Designed for MS18 Loading and to the maximum fill height shown.
All reinforcing steel shall be Grade 420 (fy = 420 MPa).
All concrete shall have a minimum 28 day compressive strength of 25 MPa.
The bottom edge of the top slab shall be chamfered 75 mm at the entrance. Reinforcing bars shall be adjusted to provide a minimum of 35 mm clear cover. Headwall heights will be reduced, if necessary, to provide a maximum 75 mm projection above the roadway slope. No increase or decrease will be made in plan quantities of concrete or reinforcing steel for this work.
Construction joints shown at the flow line may be raised a maximum of 150 mm at the Contractor's option. If this option is used, bars E may be cut off or raised, and bars C and D may be reversed.
All dimensions are in millimeters and all mass is in kilograms unless otherwise noted.

**CHANGE ORDER NO. 56**

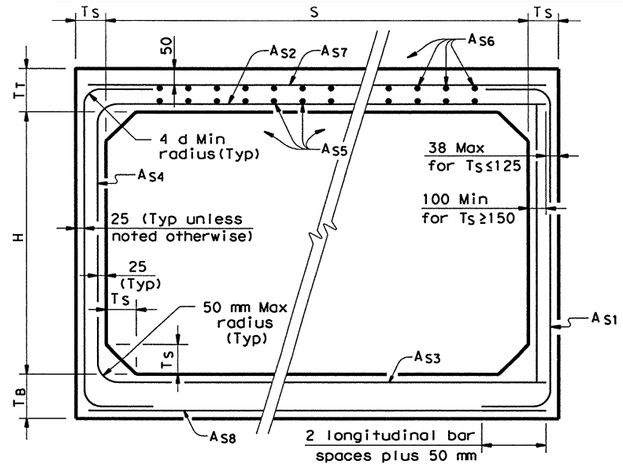
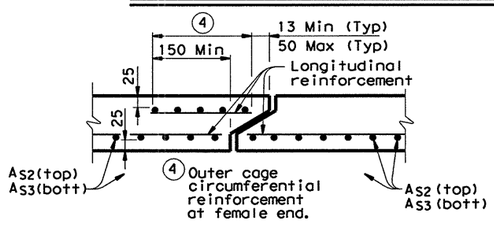
## ASTM C789M STANDARD



C850M CORNER OPTION "A"

C850M CORNER OPTION "B"

## ASTM C850M STANDARD



## SECTION A-A

(TOP AND BOTTOM SLAB JOINT REINFORCEMENT)

**GENERAL NOTES:**

Designs shown conform to ASTM C789M or ASTM C850M. Refer to ASTM C789M or ASTM C850M for information or details not shown.

For ASTM C789M designs, all reinforcing steel shall have a minimum specified yield stress of 445 MPa.

For ASTM C850M designs, all reinforcing steel shall have a minimum specified yield stress of 414 MPa.

All box concrete shall have a minimum 28 day compressive strength of 35 MPa.

See SCP-MD(M) standard sheet for miscellaneous details and notes not shown.

Designed for MS18 (HS20) loading and fill heights shown.

In lieu of furnishing the designs shown on this sheet, the contractor may furnish an alternate design that is equal to or exceeds the box design for the design fill height in the table. Shop plans for alternate designs shall be submitted in accordance with Item "Precast Concrete Structures".

All dimensions in millimeters unless otherwise shown.

⑦

Note: ASTM C850M design shall be used for direct traffic loading.

⑤ For Box Length = 2,400 mm

⑥ $A_{S1}$ thru $A_{S4}$, $A_{S7}$ and $A_{S8}$ are minimum required areas of reinforcement per linear meter of box length. $A_{S6}$ and $A_{S5}$ are minimum required areas of reinforcement per linear meter of box width.

⑦ These designs were created by TxDOT and are not shown in the ASTM Specifications.

(TOP AND BOTTOM SLAB JOINT REINFORCEMENT)

**GENERAL NOTES:**

Designs shown conform to ASTM C789M or ASTM C850M. Refer to ASTM C789M or ASTM C850M for information or details not shown.

For ASTM C789M designs, all reinforcing steel shall have a minimum specified yield stress of 445 MPa.

For ASTM C850M designs, all reinforcing steel shall have a minimum specified yield stress of 414 MPa.

All box concrete shall have a minimum 28 day compressive strength of 35 MPa.

See SCP-MD(M) standard sheet for miscellaneous details and notes not shown.

Designed for MS18 (HS20) loading and fill heights shown.

In lieu of furnishing the designs shown on this sheet, the contractor may furnish an alternate design that is equal to or exceeds the box design for the design fill height in the table. Shop plans for alternate designs shall be submitted in accordance with Item "Precast Concrete Structures".

All dimensions in millimeters unless otherwise shown.

(TOP AND BOTTOM SLAB JOINT REINFORCEMENT)

**GENERAL NOTES:**

Designs shown conform to ASTM C789M or ASTM C850M. Refer to ASTM C789M or ASTM C850M for information or details not shown.

For ASTM C789M designs, all reinforcing steel shall have a minimum specified yield stress of 445 MPa.

For ASTM C850M designs, all reinforcing steel shall have a minimum specified yield stress of 414 MPa.

All box concrete shall have a minimum 28 day compressive strength of 35 MPa.

See SCP-MD(M) standard sheet for miscellaneous details and notes not shown.

Designed for MS18 (HS20) loading and fill heights shown.

In lieu of furnishing the designs shown on this sheet, the contractor may furnish an alternate design that is equal to or exceeds the box design for the design fill height in the table. Shop plans for alternate designs shall be submitted in accordance with Item "Precast Concrete Structures".

All dimensions in millimeters unless otherwise shown.

Note: ASTM C850M design shall be used for direct traffic loading.

(5) For Box Length = 2,400 mm

(6) $A_{S1}$ thru $A_{S4}$, $A_{S7}$ and $A_{S8}$ are minimum required areas of reinforcement per linear meter of box length. $A_{S6}$ and $A_{S5}$ are minimum required areas of reinforcement per linear meter of box width.

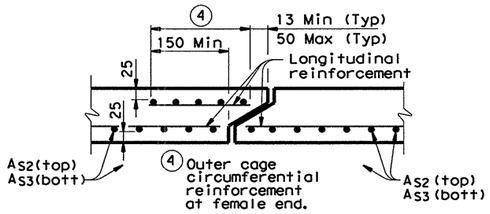
## ASTM C850M STANDARD



## SECTION A-A

(TOP AND BOTTOM SLAB JOINT REINFORCEMENT)

**GENERAL NOTES:**

Designs shown conform to ASTM C789M or ASTM C850M. Refer to ASTM C789M or ASTM C850M for information or details not shown.

For ASTM C789M designs, all reinforcing steel shall have a minimum specified yield stress of 445 MPa.

For ASTM C850M designs, all reinforcing steel shall have a minimum specified yield stress of 414 MPa.

All box concrete shall have a minimum 28 day compressive strength of 35 MPa.

See SCP-MD(M) standard sheet for miscellaneous details and notes not shown.

Designed for MS18 (HS20) loading and fill heights shown.

In lieu of furnishing the designs shown on this sheet, the contractor may furnish an alternate design that is equal to or exceeds the box design for the design fill height in the table. Shop plans for alternate designs shall be submitted in accordance with Item "Precast Concrete Structures".

All dimensions in millimeters unless otherwise shown.

DISCLAIMER:
The use of this standard is governed by the "Texas Engineering Practice Act". No warranty of any kind is made by TxDOT for any purpose whatsoever. TxDOT assumes no responsibility for the conversion of this standard to other formats or for incorrect results or damages resulting from its use.

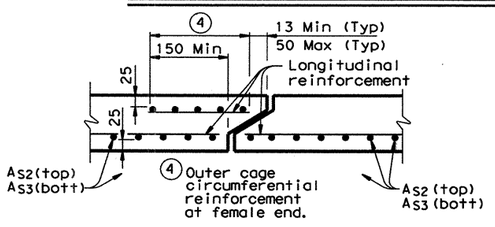
C850M CORNER OPTION "A"

C850M CORNER OPTION "B"

## ASTM C850M STANDARD



## SECTION A-A

(TOP AND BOTTOM SLAB JOINT REINFORCEMENT)

**GENERAL NOTES:**

Designs shown conform to ASTM C789M or ASTM C850M. Refer to ASTM C789M or ASTM C850M for information or details not shown.

For ASTM C789M designs, all reinforcing steel shall have a minimum specified yield stress of 445 MPa.

For ASTM C850M designs, all reinforcing steel shall have a minimum specified yield stress of 414 MPa.

All box concrete shall have a minimum 28 day compressive strength of 35 MPa.

See SCP-MD(M) standard sheet for miscellaneous details and notes not shown.

Designed for MS18 (HS20) loading and fill heights shown.

In lieu of furnishing the designs shown on this sheet, the contractor may furnish an alternate design that is equal to or exceeds the box design for the design fill height in the table. Shop plans for alternate designs shall be submitted in accordance with Item "Precast Concrete Structures".

All dimensions in millimeters unless otherwise shown.

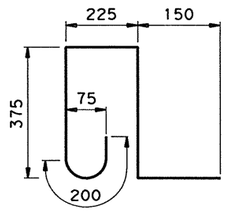
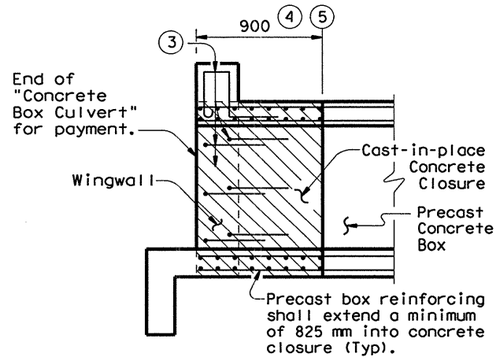
① For T6 Rail ~ see T6-CM(M) for additional details

## SECTION THRU CURB

| QUANTITITES PER METER OF CURB | |
|---|---|
| Reinforcing Steel | 6.26 kg |
| Concrete | 0.090 m3 |



**BARS K ~ #4**
(Spa = 300 mm Max)
(Length = 1290 mm)



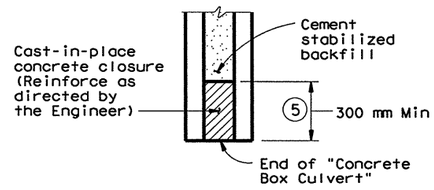
## WINGWALL CONNECTION

(ALSO APPLIES TO SAFETY END TREATMENT)

③ Curb, Wingwall or Safety End Treatment reinforcing shall extend into concrete closure. Any reinforcing that does not fit into the closure shall be bent or trimmed as necessary.

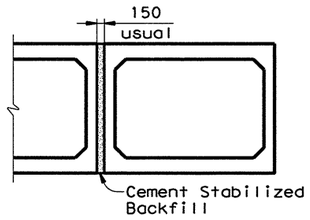
④ Cast-in-place concrete closure shall be 900mm. Boxes shall be cast short or broken back in the field.

⑤ For multiple unit placements the length of the closure for the interior walls may be adjusted as necessary. The length of the top and bottom slab closure shall not be less than 900mm. The exterior walls closure shall not be less than 900 mm unless directed otherwise by the Engineer. See "Wall Closure" detail when interior walls are cast full length.

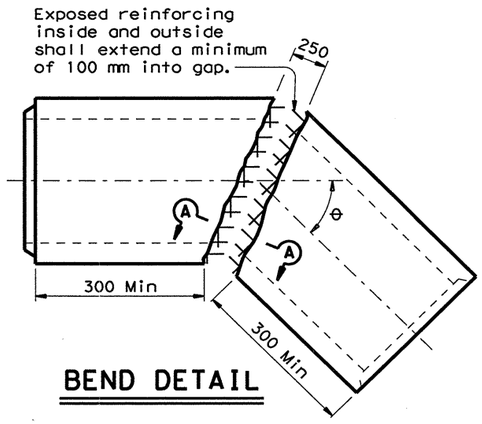


## WALL CLOSURE

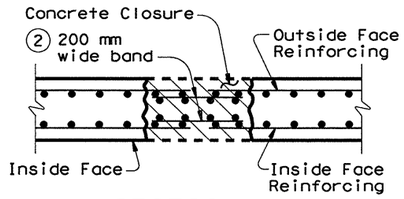
(Plan view of interior walls cast full length)



## MULTIPLE UNIT PLACEMENT



## BEND DETAIL



## SECTION A-A

② Bands matching the inside and outside face reinforcing shall be placed in the gaps of the top and bottom slabs. A band matching the outside face reinforcing of the wall shall be placed in the gaps of the walls (placed in the outside face only). The bands shall be tack welded to the exposed reinforcing at each point of contact.

### GENERAL NOTES:

All closure concrete shall meet the specified 28 day compressive strength of the box and shall be placed according to Item "Concrete Structures".

All reinforcing in the closure shall be the same size and spacing as in the precast box section.

All closures shall be flush with the inside and outside faces.

Designed for MS18 (HS20) loading.

All dimensions in millimeters unless otherwise shown.

## QUANTITIES ④ (Wings for 2 Structure Ends)

| Box Culvert Height, H | Conc ($m^3$) | Reinf (kg) |
|---|---|---|
| 600 | 1.6 | 188 |
| 900 | 2.8 | 270 |
| 1,200 | 4.0 | 357 |
| 1,500 | 6.0 | 474 |
| 1,800 | 7.8 | 680 |
| 2,100 | 10.8 | 815 |
| 2,400 | 13.3 | 1,198 |
| 2,700 | 16.0 | 2,014 |
| 3,000 | 21.7 | 2,358 |

③ When shown elsewhere on the plans, a 130 mm deep concrete riprap shall be constructed. Unless otherwise shown on the plans or directed by the Engineer, the riprap shall have a 150 mm wide by 450 mm deep reinforced concrete toewall along all edges adjacent to natural ground; the toewall shall be reinforced by extending typical riprap reinforcing into the toewall; construction joints or grooved joints, oriented in the direction of flow, shall extend across the full distance of the riprap, at intervals of approximately 6,000 mm.

④ Quantities shown are for wings only. See Item "Headwalls and Wingwalls" for a description of other components that may be included in the pay item Wingwalls.

**GENERAL NOTES:**

Designed according to AASHTO 1992 Standard and current Interim Specifications.

All reinforcing steel shall be Grade 420 (fy = 420 MPa).

All concrete shall have a minimum 28 day compressive strength of 21 MPa.

All Reinforcing bars shall be adjusted to provide a 35 mm clear cover.

The bottom slab of the barrel, wing footing and toewalls shall be placed in one continuous operation.

When structure is founded on solid rock, depth of Toe-walls for culverts and Wingwalls may be reduced or eliminated as directed by the Engineer.

All dimensions are in millimeters and all masses are in kilograms unless otherwise noted.

DISCLAIMER:
The use of this standard is governed by the "Texas Engineering Practice Act". No warranty of any kind is made by TxDOT for any purpose whatsoever. TxDOT assumes no responsibility for the conversion of this standard to other formats or for incorrect results or damages resulting from its use.

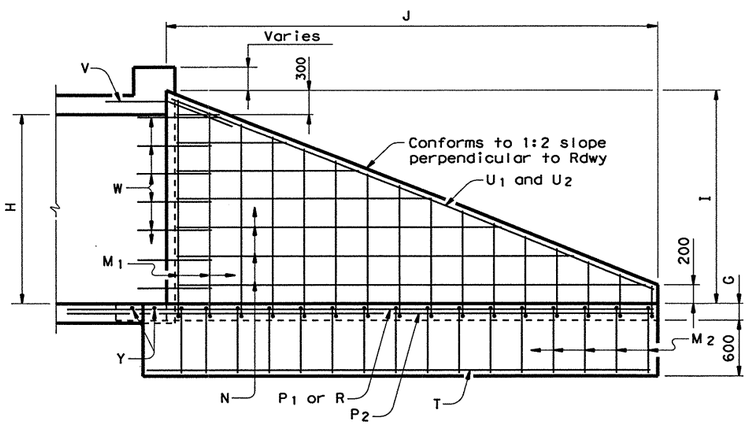
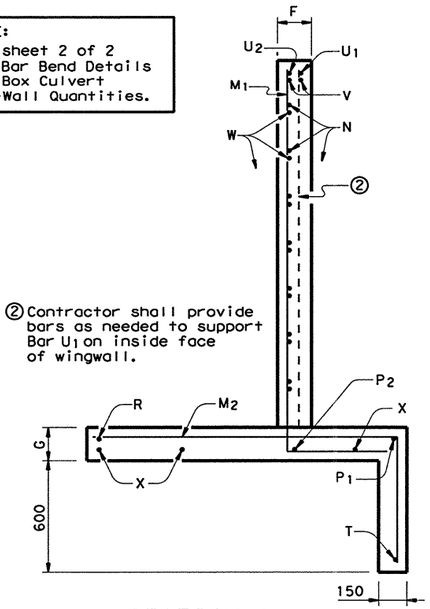
① Extend Bar $P_2$ only into bottom slab of Box Culvert.

## PLAN
### SHOWING REINFORCING

NOTE:
See sheet 2 of 2 for Bar Bend Details and Box Culvert Toe-Wall Quantities.



## ELEVATION
### SHOWING REINFORCING



## SECTION A-A

② Contractor shall provide bars as needed to support Bar $U_1$ on inside face of wingwall.

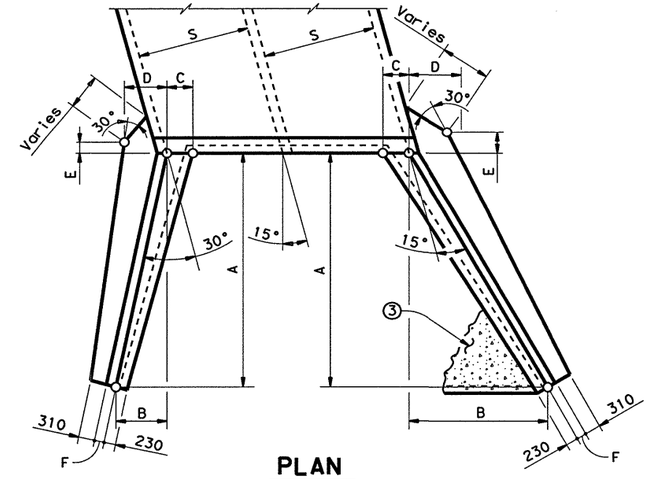
| 2,700 | 15.2 | 1,942 |
| 3,000 | 20.7 | 2,281 |



## PLAN
### SHOWING DIMENSIONS

③ When shown elsewhere on the plans, a 130 mm deep concrete riprap shall be constructed. Unless otherwise shown on the plans or directed by the Engineer, the riprap shall have a 150 mm wide by 450 mm deep reinforced concrete toewall along all edges adjacent to natural ground; the toewall shall be reinforced by extending typical riprap reinforcing into the toewall; construction joints or grooved joints, oriented in the direction of flow, shall extend across the full distance of the riprap, at intervals of approximately 6,000 mm.

④ Quantities shown are for wings only. See Item "Headwalls and Wingwalls" for a description of other components that may be included in the pay item Wingwalls.

### GENERAL NOTES:

Designed according to AASHTO 1992 Standard and current Interim Specifications.

All reinforcing steel shall be Grade 420 (fy = 420 MPa).

All concrete shall have a minimum 28 day compressive strength of 21 MPa.

All Reinforcing bars shall be adjusted to provide a 35 mm clear cover.

The bottom slab of the barrel, wing footing and toewalls shall be placed in one continuous operation.

When structure is founded on solid rock, depth of Toe-walls for culverts and Wingwalls may be reduced or eliminated as directed by the Engineer.

All dimensions are in millimeters and all masses are in kilograms unless otherwise noted.

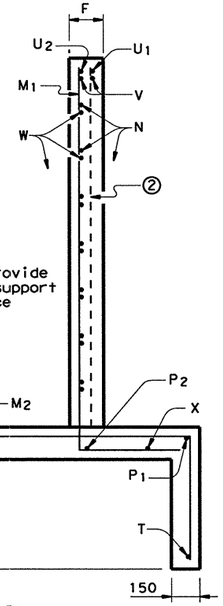
## QUANTITIES ④ (Wings for 2 Structure Ends)

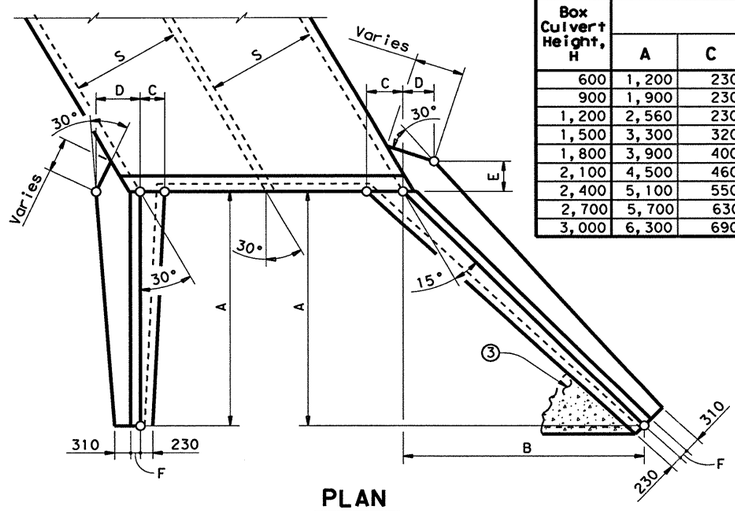
| Box Culvert Height, H | Conc ($m^3$) | Reinf (kg) |
|---|---|---|
| 600 | 1.7 | 190 |
| 900 | 2.9 | 288 |
| 1,200 | 4.2 | 372 |
| 1,500 | 6.3 | 486 |
| 1,800 | 8.1 | 706 |
| 2,100 | 11.3 | 855 |
| 2,400 | 13.9 | 1,239 |
| 2,700 | 16.7 | 2,109 |
| 3,000 | 22.8 | 2,463 |

④ Quantities shown are for wings only. See Item "Headwalls and Wingwalls" for a description of other components that may be included in the pay item Wingwalls.



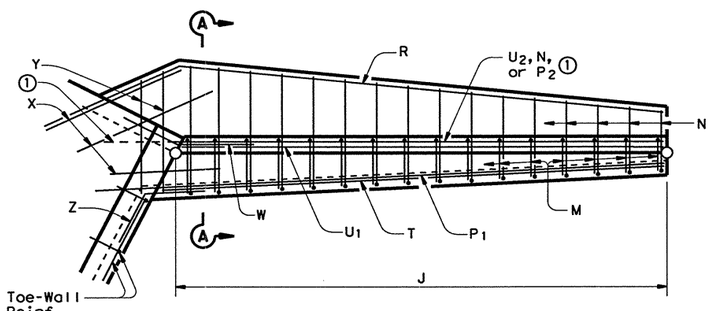
②Contractor shall provide bars as needed to support Bar $U_1$ on inside face of wingwall.

## SECTION A-A



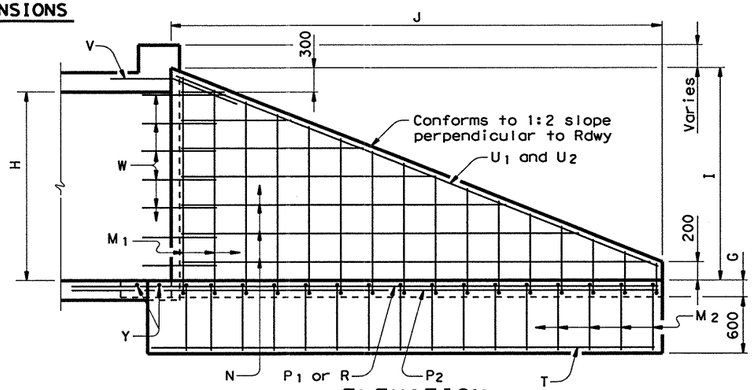
## PLAN
SHOWING DIMENSIONS

③ When shown elsewhere on the plans, a 130 mm deep concrete riprap shall be constructed. Unless otherwise shown on the plans or directed by the Engineer, the riprap shall have a 150 mm wide by 450 mm deep reinforced concrete toewall along all edges adjacent to natural ground; the toewall shall be reinforced by extending typical riprap reinforcing into the toewall; construction joints or grooved joints, oriented in the direction of flow, shall extend across the full distance of the riprap, at intervals of approximately 6,000 mm.



①Extend Bar $P_2$ only into bottom slab of Box Culvert.

## PLAN
SHOWING REINFORCING



## ELEVATION
SHOWING REINFORCING

NOTE:
See sheet 2 of 2 for Bar Bend Details and Box Culvert Toe-Wall Quantities.

### GENERAL NOTES:

Designed according to AASHTO 1992 Standard and current Interim Specifications.

All reinforcing steel shall be Grade 420 ($f_y$ = 420 MPa).

All concrete shall have a minimum 28 day compressive strength of 21 MPa.

All Reinforcing bars shall be adjusted to provide a 35 mm clear cover.

The bottom slab of the barrel, wing footing and toewalls shall be placed in one continuous operation.

When structure is founded on solid rock, depth of Toe-walls for culverts and Wingwalls may be reduced or eliminated as directed by the Engineer.

All dimensions are in millimeters and all masses are in kilograms unless otherwise noted.

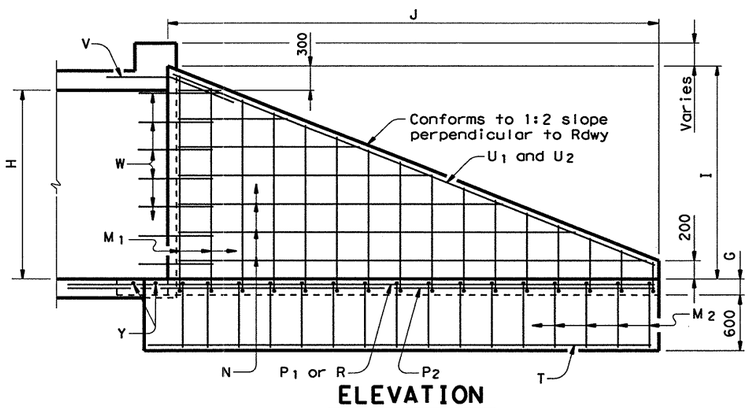
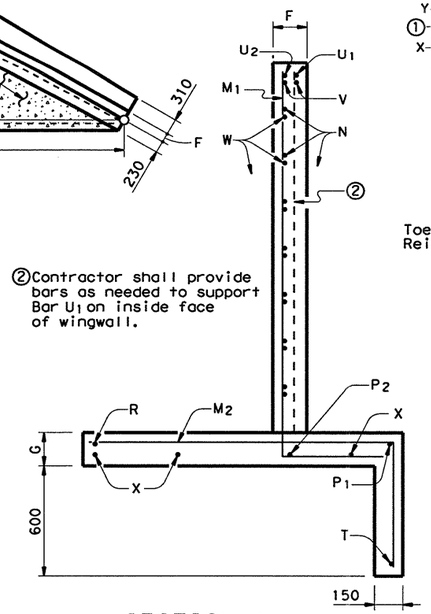
## PLAN
### SHOWING DIMENSIONS

NOTE:
See sheet 2 of 2 for Bar Bend Details and Box Culvert Toe-Wall Quantities.

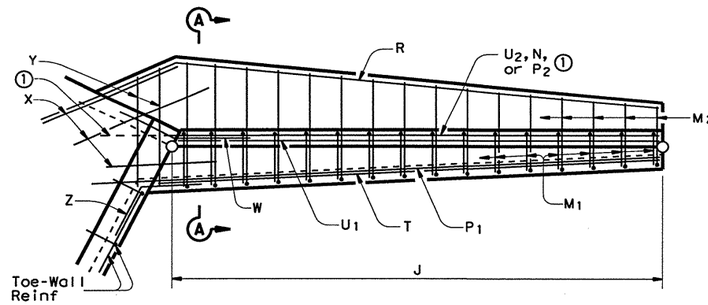


## ELEVATION
### SHOWING REINFORCING



## SECTION A-A

②Contractor shall provide bars as needed to support Bar U1 on inside face of wingwall.



①Extend Bar P2 only into bottom slab of Box Culvert.

## PLAN
### SHOWING REINFORCING

③When shown elsewhere on the plans, a 130 mm deep concrete riprap shall be constructed. Unless otherwise shown on the plans or directed by the Engineer, the riprap shall have a 150 mm wide by 450 mm deep reinforced concrete toewall along all edges adjacent to natural ground; the toewall shall be reinforced by extending typical riprap reinforcing into the toewall; construction joints or grooved joints, oriented in the direction of flow, shall extend across the full distance of the riprap, at intervals of approximately 6,000 mm.

## QUANTITIES ④ (Wings for 2 Structure Ends)

| Box Culvert Height, H | Conc ($m^3$) | Reinf (kg) |
|---|---|---|
| 600 | 2.1 | 220 |
| 900 | 3.7 | 332 |
| 1,200 | 5.3 | 434 |
| 1,500 | 7.9 | 582 |
| 1,800 | 10.2 | 852 |
| 2,100 | 14.2 | 1,033 |
| 2,400 | 17.5 | 1,500 |
| 2,700 | 21.0 | 2,562 |
| 3,000 | 28.6 | 3,033 |

④Quantities shown are for wings only. See Item "Headwalls and Wingwalls" for a description of other components that may be included in the pay item Wingwalls.

**GENERAL NOTES:**

Designed according to AASHTO 1992 Standard and current Interim Specifications.

All reinforcing steel shall be Grade 420 (fy = 420 MPa).

All concrete shall have a minimum 28 day compressive strength of 21 MPa.

All Reinforcing bars shall be adjusted to provide a 35 mm clear cover.

The bottom slab of the barrel, wing footing and toewalls shall be placed in one continuous operation.

When structure is founded on solid rock, depth of Toe-walls for culverts and Wingwalls may be reduced or eliminated as directed by the Engineer.

All dimensions are in millimeters and all masses are in kilograms unless otherwise noted.

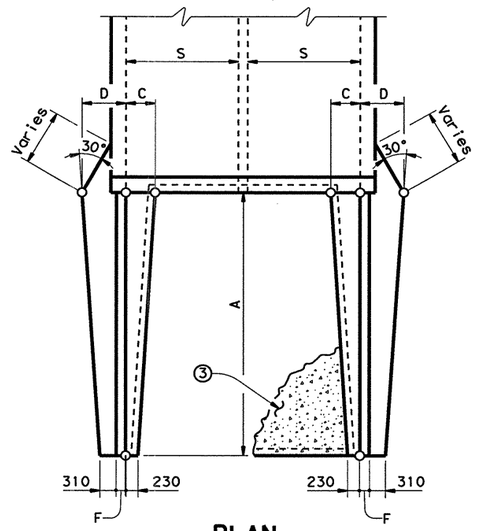
## SECTION A-A

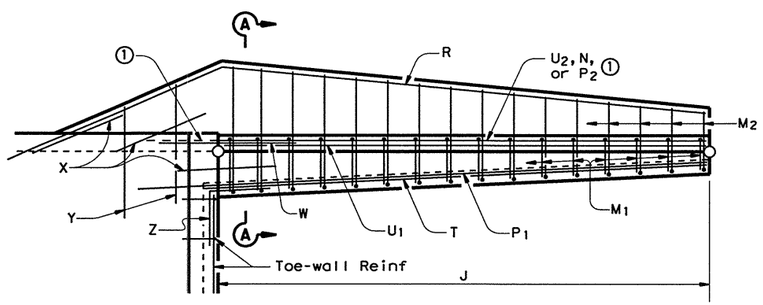
② Contractor shall provide bars as needed to support Bar $U_1$ on inside face of wingwall.

③ When shown elsewhere on the plans, a 130 mm deep concrete riprap shall be constructed. Unless otherwise shown on the plans or directed by the Engineer, the riprap shall have a 150 mm wide by 450 mm deep reinforced concrete toewall along all edges adjacent to natural ground; the toewall shall be reinforced by extending typical riprap reinforcing into the toewall; construction joints or grooved joints, oriented in the direction of flow, shall extend across the full distance of the riprap, at intervals of approximately 6,000 mm.

NOTE:
See sheet 2 of 2 for Bar Bend Details and Box Culvert Toe-Wall Quantities.



## PLAN
### SHOWING DIMENSIONS



① Extend Bar $P_2$ only into bottom slab of Box Culvert.

## TABLE OF DIMENSIONS

| Box Culvert Height, H | Both Walls | | | | | | |
|---|---|---|---|---|---|---|---|
| | A | C | D | F | G | I | J |
| 600 | 1,200 | 230 | 470 | 160 | 160 | 800 | 1,200 |
| 900 | 1,900 | 230 | 470 | 160 | 160 | 1,150 | 1,900 |
| 1,200 | 2,560 | 230 | 470 | 160 | 160 | 1,480 | 2,560 |
| 1,500 | 3,300 | 320 | 630 | 160 | 160 | 1,850 | 3,300 |
| 1,800 | 3,900 | 400 | 710 | 160 | 160 | 2,150 | 3,900 |
| 2,100 | 4,500 | 460 | 820 | 180 | 180 | 2,450 | 4,500 |
| 2,400 | 5,100 | 550 | 910 | 180 | 180 | 2,750 | 5,100 |
| 2,700 | 5,700 | 630 | 980 | 180 | 180 | 3,050 | 5,700 |
| 3,000 | 6,300 | 690 | 1,100 | 210 | 210 | 3,350 | 6,300 |

## QUANTITIES ④
(Wings for 2 Structure Ends)

| Box Culvert Height, H | Conc ($m^3$) | Reinf (kg) |
|---|---|---|
| 600 | 1.4 | 178 |
| 900 | 2.4 | 263 |
| 1,200 | 3.5 | 334 |
| 1,500 | 5.2 | 434 |
| 1,800 | 6.8 | 625 |
| 2,100 | 9.5 | 757 |
| 2,400 | 11.7 | 1,080 |
| 2,700 | 14.0 | 1,813 |
| 3,000 | 19.2 | 2,143 |

④ Quantities shown are for wings only. See Item "Headwalls and Wingwalls" for a description of other components that may be included in the pay item Wingwalls.

**GENERAL NOTES:**

Designed according to AASHTO 1992 Standard and current Interim Specifications.

All reinforcing steel shall be Grade 420 (fy = 420 MPa).

All concrete shall have a minimum 28 day compressive strength of 21 MPa.

All Reinforcing bars shall be adjusted to provide a 35 mm clear cover.

The bottom slab of the barrel, wing footing and toewalls shall be placed in one continuous operation.

When structure is founded on solid rock, depth of Toe-walls for culverts and Wingwalls may be reduced or eliminated as directed by the Engineer.

All dimensions are in millimeters and all masses are in kilograms unless otherwise noted.

DISCLAIMER:
The use of this standard is governed by the "Texas Engineering Practice Act". No warranty of any kind is made by TxDOT for any purpose whatsoever. TxDOT assumes no responsibility for the conversion of this standard to other formats or for incorrect results or damages resulting from its use.

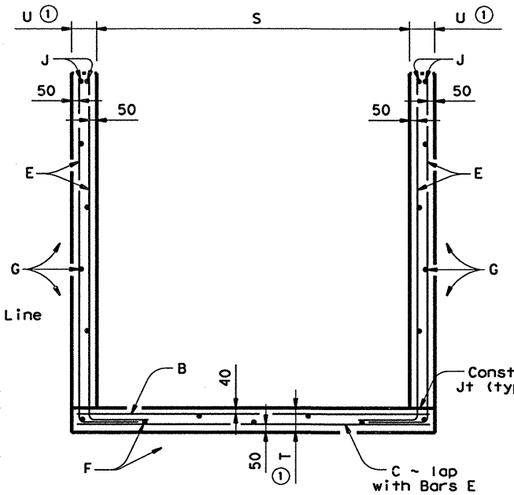
## TYPICAL ELEVATION

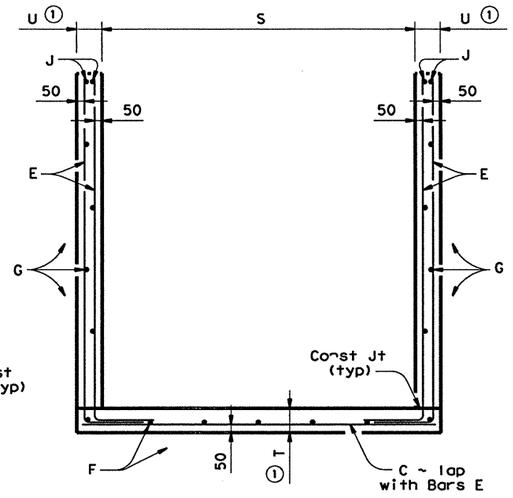
(Shown at 1:4 Slope)

② Minimum 300 mm lap with extended culvert reinforcement may also be used.



## SECTION A-A

(SINGLE CULVERT)
(S > 1,200)



## SECTION A-A

(SINGLE CULVERT)
(S ≤ 1,200)

① 150 min or may be same thickness as adjacent culvert

### QUANTITY CALCULATIONS ③

S = Clear Span of each Barrel
H = Height of Barrels
N = Number of Barrels
SL = Side Slope Ratio
W = N(S)+150(N+1)
L = (H+50)SL

### CONCRETE VOLUME

$[150(W)(L)+67,500(W)+75(H+250)(L)(N+1)]\ \frac{1}{10^9}\ m^3$

### SHEET QUANTITY CALCULATIONS

| Bar | Unit Weight (kg/m) | Average Length (mm) | Number of Bars |
|---|---|---|---|
| B ⑤ | .994 | (W-75) | $\left(\frac{L}{250}+.5\right)^{④}$ |
| C | .994 | (W-75) | $\left(\frac{L}{250}+.5\right)^{④}$ |
| E | .994 | $\left(\frac{H+1,050}{2}\right)$ | $\left(\frac{L}{250}+.5\right)^{④}(N+1)(2)$ |
| F | .994 | (L+260) | $N\left(\frac{S}{300}+1\right)^{④}+1$ |
| G | .994 | $\left(\frac{SL}{2}(H+200)+300\right)$ | $\left(\frac{H}{375}-1\right)^{④}(N+1)$ |
| J | .994 | $\left(\sqrt{SL^2+1}\right)(L)+260)$ | (N+1)(2) |

③ Based on T and U = 150 mm. Interior Wings with multiple precast box culverts are assumed at 150 mm.

④ If not an integer, round up to next highest integer.

⑤ Omit Bars B if S ≤ 1,200 mm.

### EXAMPLE 1

(Single Barrel ~ 1,200 x 900
1:6 slope)

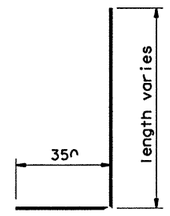
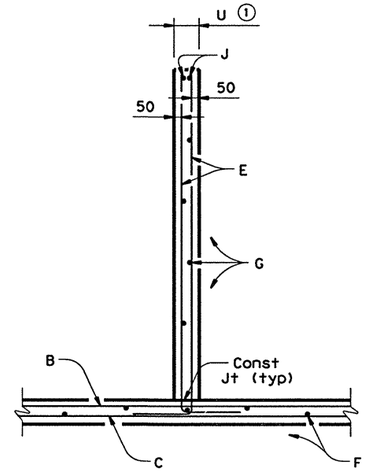
## PLAN

(INTERIOR WING EXTENSIONS FOR MULTIPLE BOX CULVERTS)



BARS E



## SECTION A-A

(INTERIOR WING ~ MULTIPLE CULVERTS)

### GENERAL NOTES:

The quantities for concrete and reinforcing steel resulting from the formulas given on this sheet are for Contractor's information only.

Quantities are for one complete end, either single or multiple box, and are included in the price bid for each Safety End Treatment.

Additional Riprap as indicated elsewhere in the plans will also be included in the price bid for Safety End Treatment.

All dimensions are in millimeters unless otherwise noted.

Include this sheet in plans only when single or multiple Box Culverts require treatment.

BASED ON 68 X 13 CORRUGATION
"G" IS MEASURED BETWEEN THE OUTER SURFACES OF THE PIPES.

### NOTES:

1.) FOR RIPRAP QUANTITIES AND SLOPES, SEE CULVERT LAYOUT SHEET. CONCRETE SHALL BE CLASS B UNLESS OTHERWISE SHOWN IN THE PLANS.

2.) ALL METAL PIPES (CIRCULAR AND/OR ARCH) SHALL HAVE 5/8" X 6" GALVANIZED BOLTS WITH 2 HEX NUTS AT 600 mm MAX. CENTERS TO ANCHOR THE PIPE TO THE CONCRETE. THIS WORK WILL BE SUBSIDIARY TO THE RIPRAP HEADWALL.

3.) FOR CONCRETE ARCH PIPES, THE CMP ARCH PIPE CULVERT DIMENSIONS WILL HAVE TO BE ADJUSTED FOR THE PIPE WALL THICKNESS.

4.) FOR PIPES LARGER THAN SHOWN, USE THE CLEAR DISTANCE BETWEEN PIPES SHOWN IN ITEMS 460 AND/OR 464.

5.) IF THE SIDES OF THE HEADWALL IS ADJACENT TO A RIPRAP SLOPE AND IF THE TOP OF THE HEADWALL IS ADJACENT TO THE ROADWAY FOUNDATION OR RIPRAP SLOPE, THE SIDE AND TOP TOE WALLS MAY BE ELIMINATED IF APPROVED BY THE ENGINEER.

6.) ALL DIMENSIONS ARE IN mm UNLESS SHOWN OTHERWISE.

GENERAL NOTES:

Precast safety end treatment for reinforced concrete pipe may be used for TYPE 11 end treatment as specified in Item "Safety End Treatment".

The Safety End Treatment option shown on sheet 1 of 2 should only be utilized as indicated in the table on this sheet.

All precast concrete end sections shall be manufactured in accordance with Item "Reinforced Concrete Pipe Culverts" and in accordance with ASTM Specification C-76, Wall B for circular pipe.

Precast concrete end sections shall be provided with a tongue or groove end for compatability to upstream or downstream end conditions with sufficient annular space to allow for mortar, cold applied asphalt joint compound or pre-formed plastic gasket material.

Methods of lifting shall be provided by the manufacturer for ease of loading, unloading and installation.

All exposed corners shall be tooled to prevent sharp edges which might be subject to chipping or spalling.

Design requirements for the treatment of culvert ends must conform to the "Highway Design Division Operations and Procedures Manual 1-86".

The details for safety pipe runners shown on this sheet conform to the "Highway Design Division Operations and Procedures Manual 1-86", which addresses the basic design requirements concerning culvert ends.

All dimensions are in millimeters unless otherwise noted.

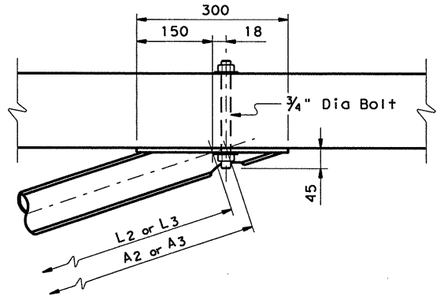
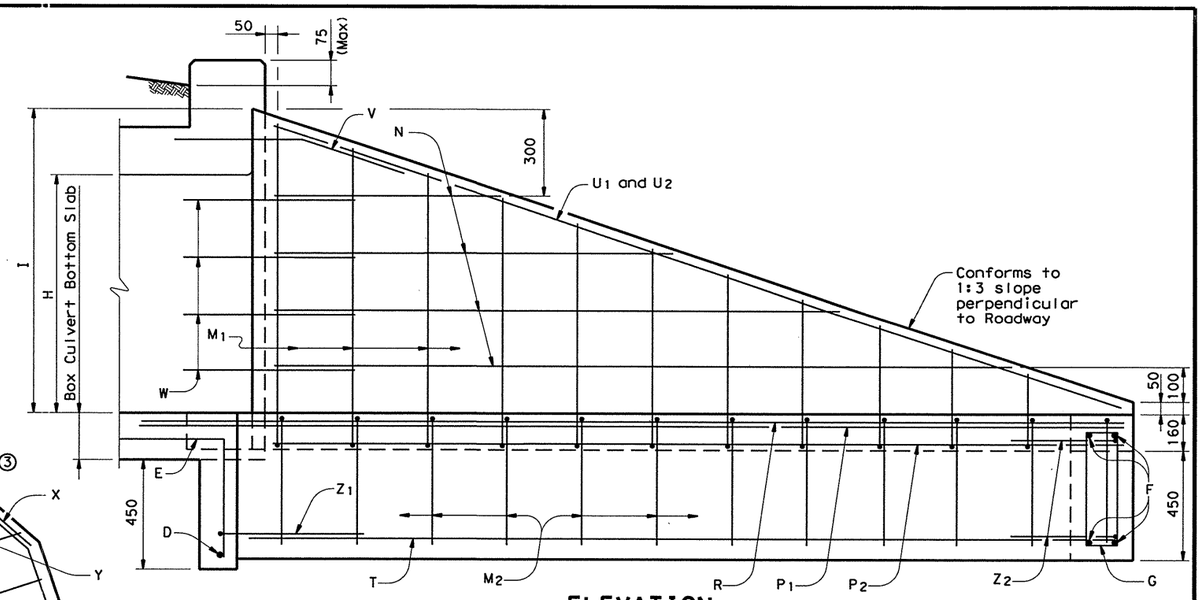
## ELEVATION AT WING

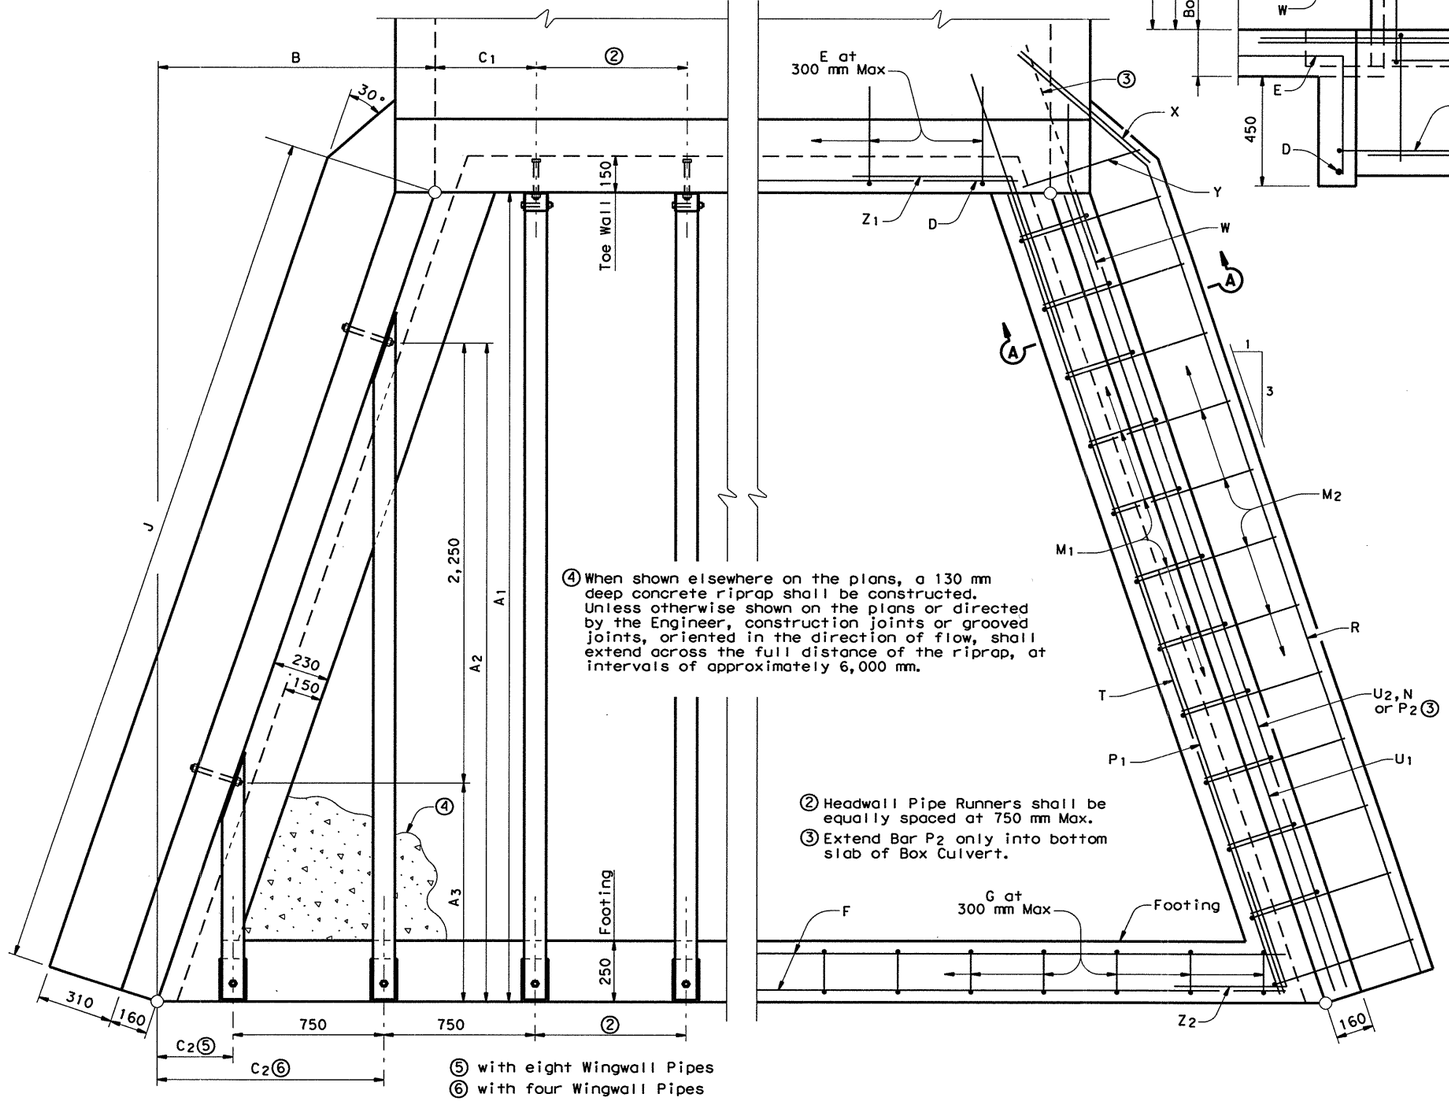


## SECTION AT WING



## ELEVATION

(PERPENDICULAR TO WINGWALL)



④ When shown elsewhere on the plans, a 130 mm deep concrete riprap shall be constructed. Unless otherwise shown on the plans or directed by the Engineer, construction joints or grooved joints, oriented in the direction of flow, shall extend across the full distance of the riprap, at intervals of approximately 6,000 mm.

② Headwall Pipe Runners shall be equally spaced at 750 mm Max.

③ Extend Bar $P_2$ only into bottom slab of Box Culvert.

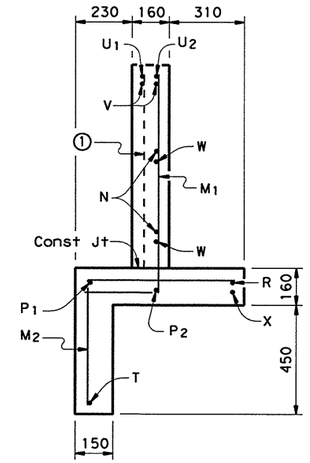
⑤ with eight Wingwall Pipes

⑥ with four Wingwall Pipes

## SHOWING DIMENSIONS

## PLAN

## SHOWING REINFORCING



## SECTION A-A

① Contractor shall provide bars as needed to support Bar $U_1$ on inside face of wingwall.

**GENERAL NOTES:**

All reinforcing steel shall be Grade 420 (fy = 420 MPa)

All concrete shall have a minimum 28 day compressive strength of 21 MPa.

All pipe runners shall be 80 mm in diameter and shall conform to ASTM A53. Pipe runners less than or equal to 3,600 mm in length shall be standard weight (Schedule 40). Pipe runners greater than 3,600 mm in length shall be extra strong (Schedule 80).

All bolts, nuts, washers, brackets, angles and pipe runners are considered parts of the Safety End Treatment for payment.

Bolts and nuts shall conform to ASTM A307.

Holes shall be 1/16" oversize unless otherwise noted.

Steel plate shall conform to ASTM A36.

Dimensions relating to reinforcing steel are to centers of bars.

All reinforcing bars shall be adjusted to provide a 35 mm clear cover.

Chamfer exposed corners 20 mm except as otherwise noted.

All exposed steel shall be galvanized unless otherwise shown on plans. Galvanizing damaged during transport and construction shall be repaired in accordance with the specifications.

All dimensions are in millimeters and masses are in kilograms unless otherwise noted.

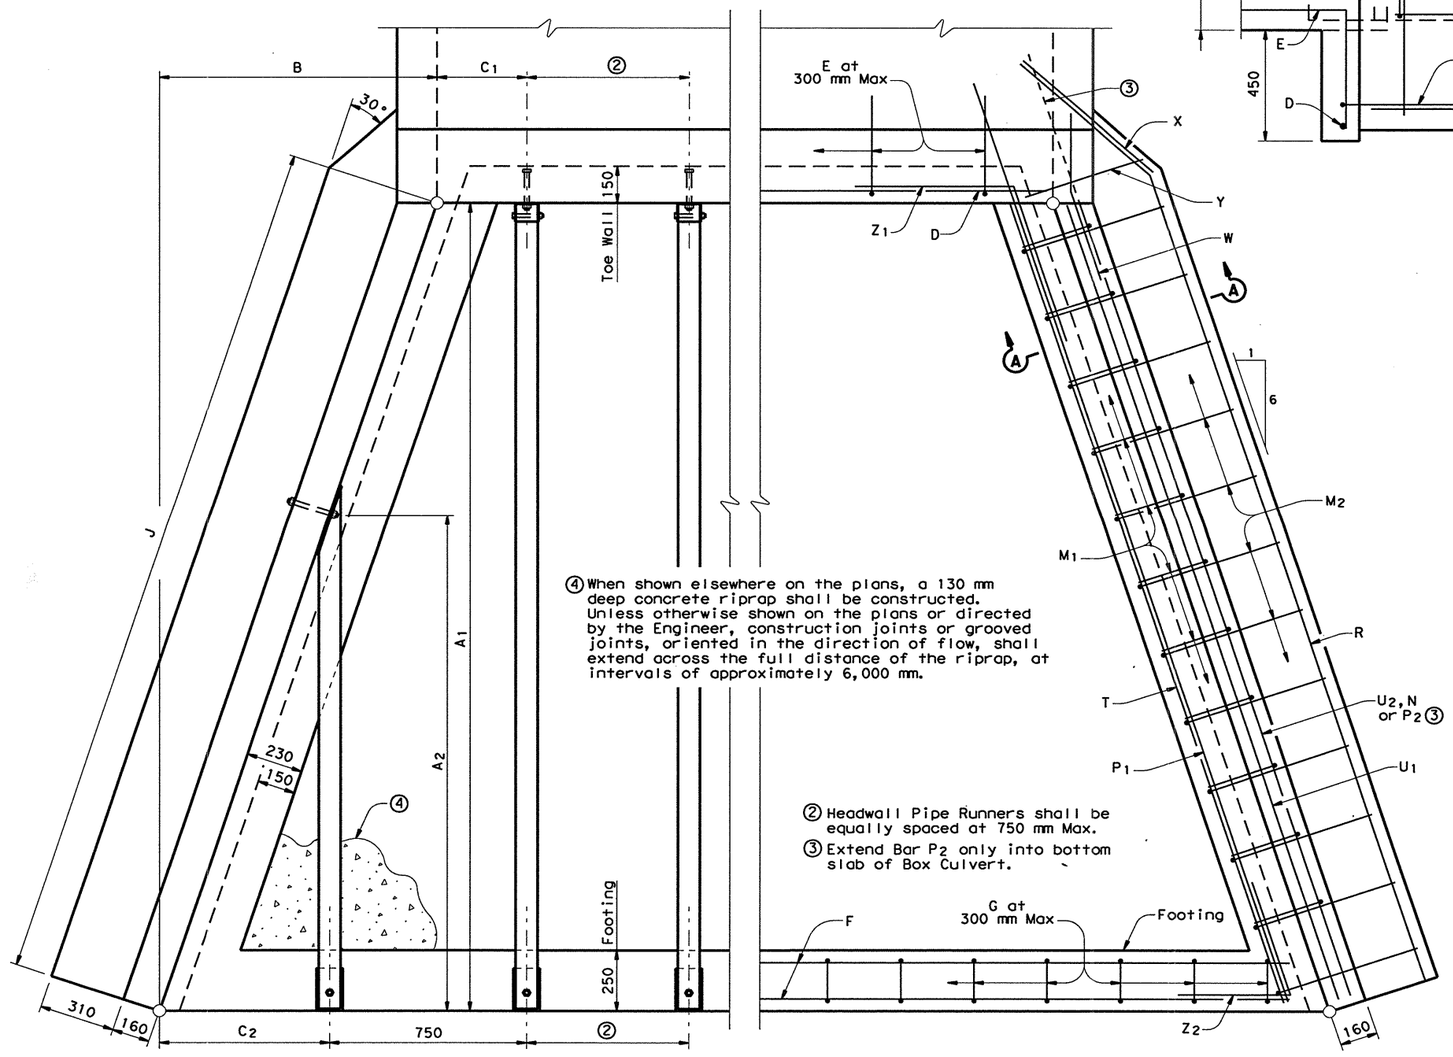
## ELEVATION

(PERPENDICULAR TO WINGWALL)



## SHOWING DIMENSIONS

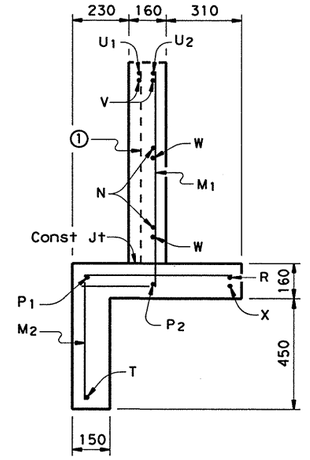
## PLAN

## SHOWING REINFORCING

④ When shown elsewhere on the plans, a 130 mm deep concrete riprap shall be constructed. Unless otherwise shown on the plans or directed by the Engineer, construction joints or grooved joints, oriented in the direction of flow, shall extend across the full distance of the riprap, at intervals of approximately 6,000 mm.

② Headwall Pipe Runners shall be equally spaced at 750 mm Max.

③ Extend Bar $P_2$ only into bottom slab of Box Culvert.



## SECTION A-A

① Contractor shall provide bars as needed to support Bar $U_1$ on inside face of wingwall.

**GENERAL NOTES:**

All reinforcing steel shall be Grade 420 (fy = 420 MPa)

All concrete shall have a minimum 28 day compressive strength of 21 MPa.

All pipe runners shall be 80 mm in diameter and shall conform to ASTM A53. Pipe runners less than or equal to 3,600 mm in length shall be standard weight (Schedule 40). Pipe runners greater than 3,600 mm in length shall be extra strong (Schedule 80).

All bolts, nuts, washers, brackets, angles and pipe runners are considered parts of the Safety End Treatment for payment.

Bolts and nuts shall conform to ASTM A307.

Holes shall be 1/16" oversize unless otherwise noted.

Steel plate shall conform to ASTM A36.

Dimensions relating to reinforcing steel are to centers of bars.

All reinforcing bars shall be adjusted to provide a 35 mm clear cover.

Chamfer exposed corners 20 mm except as otherwise noted.

All exposed steel shall be galvanized unless otherwise shown on plans. Galvanizing damaged during transport and construction shall be repaired in accordance with the specifications.

All dimensions are in millimeters and masses are in kilograms unless otherwise noted.

② Anchor Pipe may be any of the above materials and shall have an O.D. of 6 mm to 16 mm less than the I.D. of the Safety Pipe Runners.
③ For anchor pipe using Option C for lower anchorage, add 375 mm to the value for "L" in the above table.

DESIGN: Safety Pipe Runners are designed for a traversing load of 8,000 N at yield as recommended by Research Report 280-1, Safety Treatment of Roadside Cross-Drainage Structures, Texas Transportation Institute, March 1981.

**GENERAL NOTES:**

These details are to be used as a guide for installation of safety pipe runners for cross-drainage structures where out of control vehicles may traverse the openings approximately perpendicular to the safety pipe runners. Some installations may require the preparation of special details. In general, safety pipe runners are installed on cross-drainage structures at maximum spacings of approximately 750 mm.

Installation of safety pipe runners for single or multiple culverts will be in accordance with the details shown if the use of safety pipe runners are specified elsewhere in the plans.

Payment for riprap (if required) and toe wall footing is included in the price bid for each Safety Pipe End Treatment.

All dimensions are in millimeters unless otherwise noted.

DESIGN: Safety Pipe Runners are designed for a traversing load of 44,480 N at yield as recommended by Research Report 280-2F, Safety Treatment of Roadside Parallel-Drainage Structures, Texas Transportation Institute, June 1981.

**GENERAL NOTES:**

These details are to be used as a guide for installation of safety pipe runners for parallel drainage structures where out of control vehicles may impact the openings approximately perpendicular to the safety pipe runners. Some installations may require the preparation of special details. In general, safety pipe runners are installed on parallel drainage structures at maximum spacings of approximately 600 mm.

Installation of safety pipe runners for single or multiple culverts will be in accordance with the details shown if the use of safety pipe runners are specified elsewhere in the plans.

Payment for riprap (if required) and toe wall footing is included in the price bid for each Safety Pipe End Treatment.

All dimensions are in millimeters unless otherwise noted.

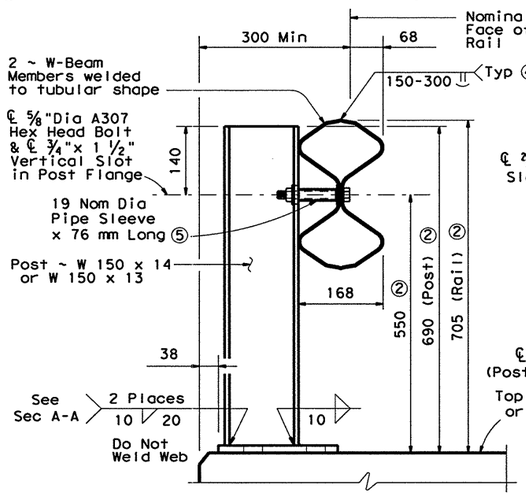
## INSIDE ELEVATION OF RAIL

③ Maintain 1,905 mm Post spacing wherever possible for use with nominal 7,620 mm W-Beam sections (7,940 mm Overall). Symmetry of post spacing is not necessary. A single 2,286 mm space followed by a single 1,524 mm space is acceptable where necessary to miss joints.

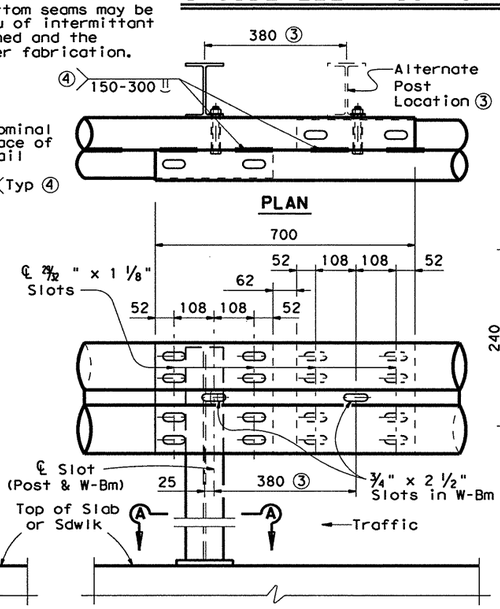
④ Tubular W-Beam Rail Member is to be fabricated from nominal 7,620 mm W-Beam sections (7,940 mm Overall). Additional post mounting slots are to be made in each member 380 mm from the standard slots at 1,905 mm centers. Top and bottom seams may be continuously welded with 80% penetration in lieu of intermittant welding shown. Welds shall be chipped and cleaned and the complete 8,320 mm tubular member galvanized after fabrication.

⑤ See Section Thru Splice for Washers

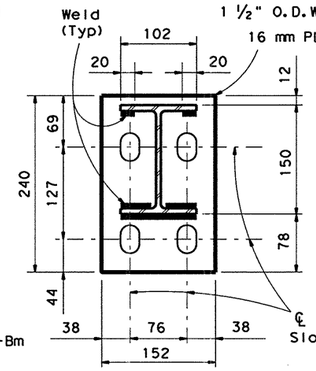
② Increase 50 mm for Structures with Overlay



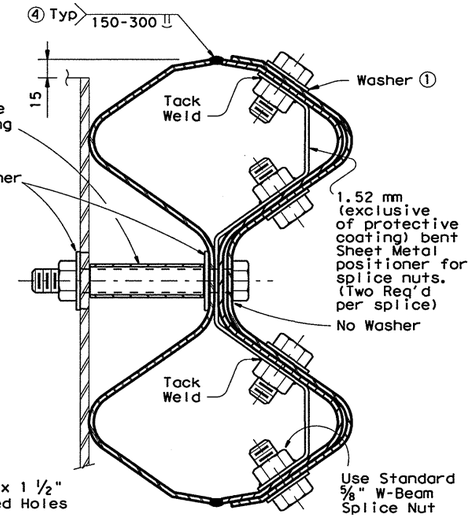
## SECTION THRU RAIL



## TUBULAR W-BEAM SPLICE DETAILS



## SECTION A-A



## SECTION THRU SPLICE

① 8~ 5/8" Splice nuts shall be tacked to bent sheet metal postioners as shown. Other suitable positioning methods or devices may be substituted. The complete splice shall have 16 bolts. Each bolt will include a 5 x 45 x 75 mm plate washer or a 1 3/4" O.D. washer.

Member shall be Steel ~ Nom thickness = 2.66 mm exclusive of protective coating. Actual section may vary slightly with the manufacturer.

## W-BEAM SECTION

GENERAL NOTES:

This rail has been successfully evaluated by full scale impact tests conducted in accordance with NCHRP Report 230. Test documentation may be found in Research Report 230-1, "Tubular W-Beam Bridge Rail", of Research study 2-5-78-230 "Bridge Rail to contain Heavy Trucks and Buses", Texas Transportation Institute, October 1978.

Tubular Rail Member shall be extended and connected to at least the first soil embedded post at each end of the structure. More such posts shall be used to utilize 7,620 mm standard sections. Approach guard fence posts shall be spaced at 1,905 mm adjacent to the Tubular Rail since its flexibility is similar to standard metal beam guard fence. Do not install additional posts at 953 mm centers. Payment for this rail shall be in increments of 7,620 mm.

Face of rail and posts shall be vertical transversely unless otherwise approved by the Engineer. Posts shall be perpendicular to adjacent roadway grade. Grout may be used under base plates if necessary.

All posts, w-beam, pipe, sheet metal, bolts, nuts, washers, and bottom plates are considered as parts of the rail for payment.

All steel components except reinforcing shall be galvanized unless otherwise shown in plans. Exposed edges of handrail and handrail posts shall be rounded or chamfered to approximately 2 mm by grinding. Rail shall be extended across all fixed armor joints, slab span joints, or pan form joints with no change in post spacing or continuity. At expansion armor joints of 32 mm or less, the splice bolts nearest the joint and post mounting bolts at intervening post shall be snugly tightened to allow for rail expansion. At expansion armor joints over 32 mm, suitably longer splice holes shall be provided.

Anchor bolts shall be 7/8" Dia ASTM A307 Grade A bolts (or A36 threaded rods with one tack welded hex nut each) with one hex nut and one hardened steel washer at each bolt. Threaded rods may be 0.781" minimum diameter with rolled threads. Nuts shall conform to A563 requirements. The untapped blanks shall be galvanized prior to cutting the threads. Threads for bolts and nuts shall have Class 2A and 2B fit tolerances in accordance with ANSI B1.1.

Shop drawings to be submitted to the Bridge Engineer for approval are required only for the proposed rail splices at armor expansion joints greater than 32 mm and for rails on horizontal curves in which case the Tubular Rail member shall be fabricated to the required radius if the radius is 183 meters or less. For rails not requiring shop drawings, erection drawings showing splice locations shall be submitted to the Area Engineer for approval. Shop or Erection Drawings may be 280 x 432 mm or larger.

All dimensions are in millimeters unless otherwise shown.

Average mass of railing (1,905 mm Post spa and no Overlay) = 34 kg/m.

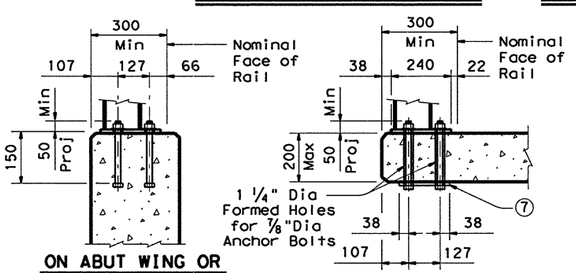
DESIGN CRITERIA

This rail is intended to be used only for curbless structures.

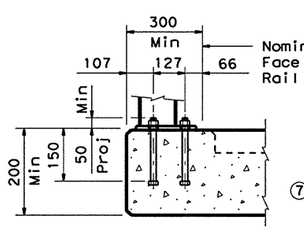
Fully anchored guard fence must be attached to both ends of rail.

Tests have shown that although this rail deflects horizontally 600 to 900 mm, adequate vehicle containment and re-direction is achieved. The resulting more gradual deceleration thus produces a safer condition than afforded by other bridge railings.

This railing is especially suitable for use on bridge width box culverts. The detail sheet titled "Culvert Mounting For T6(M) Traffic Rail, Type T6-CM(M)" is then required to show headwall and wingwall modifications and additional reinforcing steel to be included as part of the railing for payment.

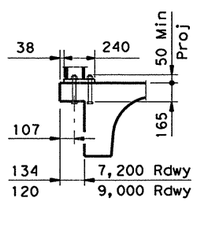


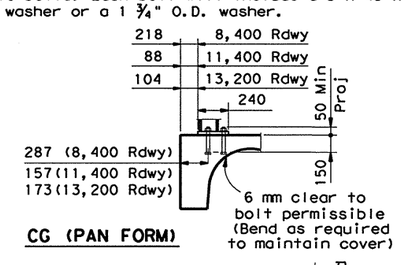
ON ABUT WING OR CIP RETAINING WALL — FOR 200 mm MAX CONC DEPTH



FOR 200 mm MIN CONC DEPTH

⑦PL 6 x 152 x 203 ( 15/16" Dia Holes)



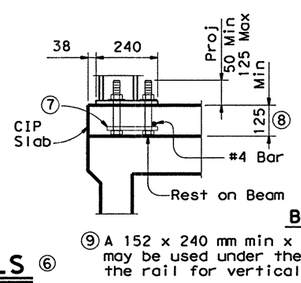


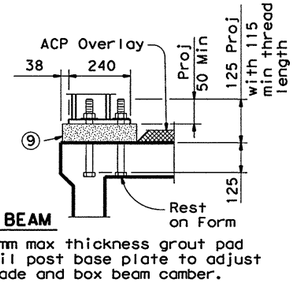
CG (PAN FORM)

⑥ For temporary installations (posted speed 72 km/h or less) only the front two bolts are necessary. Optional 0.875 inch diameter anchorages with resin binder in capsules or other two-component system may be used provided a minimum ultimate tensile strength of 88,964 N per front anchor can be obtained. If posted temporary speed is greater than 72 km/h, the minimum tensile strength must be 123,216 N per front anchor. For permanent installations, the minimum ultimate tensile strength must be 123,216 N per front anchor and 66,723 N per rear anchor. Depth of holes and installation shall be in accordance with manufacturer's recommendations such that the full required minimum tensile strength can be obtained. Drilled holes for resin or other two-component anchorage systems must be power wire brushed. Compressed air, if used to help clean holes, shall have no oil in suspensions. Field tests in accordance with ASTM E488 may be used if permitted and/or required by the Engineer to demonstrate minimum tensile strength.

⑧ For CIP slabs under 150 mm add PL ⑦ (tack weld to bolt heads) and an additional longitudinal #4 bar as shown (included as part of rail for payment).

## POST MOUNTING DETAILS ⑥





BOX BEAM

⑨ A 152 x 240 mm min x 75 mm max thickness grout pad may be used under the rail post base plate to adjust the rail for vertical grade and box beam camber.

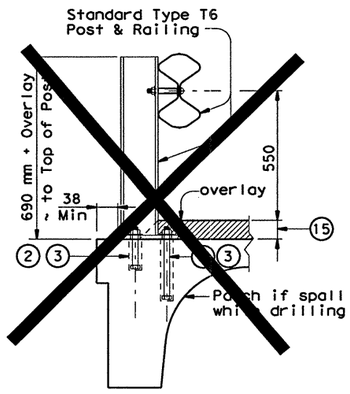
# CULVERT MOUNTING FOR T6(M) TRAFFIC RAIL

## T6-CM(M)

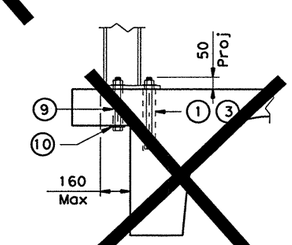
| FILE: rlstd022.dgn | DN: JJP | CK: THD | DW: KDK | CK: LDS | STD: B584M |
|---|---|---|---|---|---|
| © TxDOT January 1996 | DIST | FED REG | FEDERAL AID PROJECT • | | SHEET |
| REVISIONS | SAT | 6 | NH 2000 (704), etc. | | 427 |
| | COUNTY | | CONTROL | SECT | JOB | HIGHWAY |
| | BEXAR | | 2452 | 01 | 036, etc | LP1604 |

DISCLAIMER:
The use of this standard is governed by the "Texas Engineering Practice Act". No warranty of any kind is made by TxDOT for any purpose whatsoever. TxDOT assumes no responsibility for the conversion of this standard to other formats or for incorrect results or damages resulting from its use.

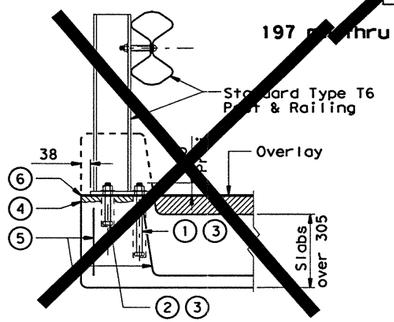
LEVELS DI... ACC:
(LV=1,2 for English; 1,3 for Metric)

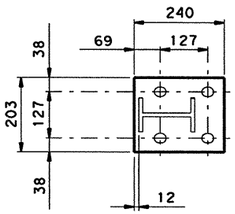


0 & 44 mm Overhang

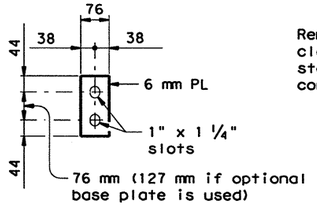


197 mm thru 540 mm Overhangs

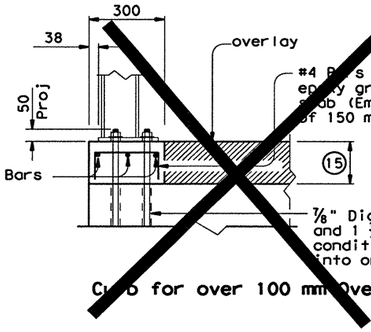




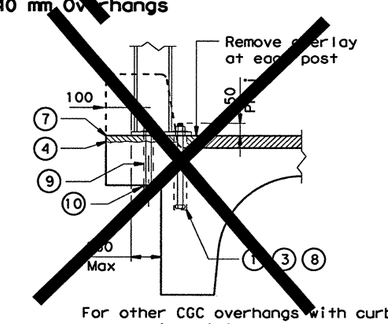
OPTIONAL 20 mm BASE PLATE
(May be used to provide clearance for drilling of holes in existing bridge deck).

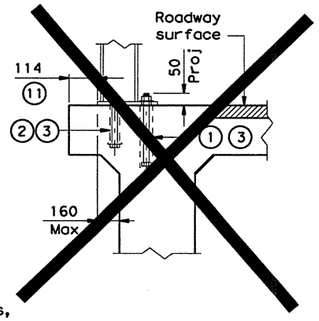


⑩ BOTTOM PLATE

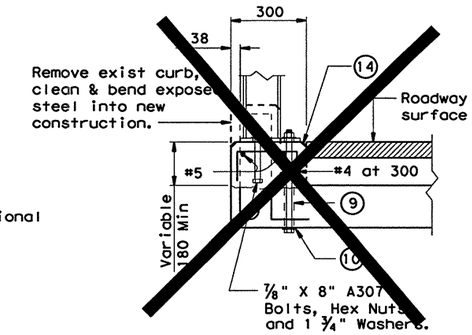


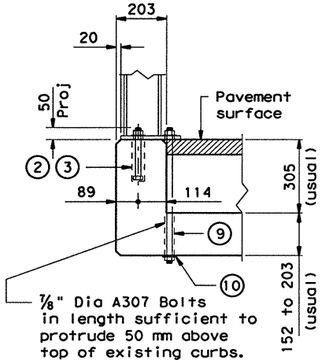
Curb for over 100 mm Overlay

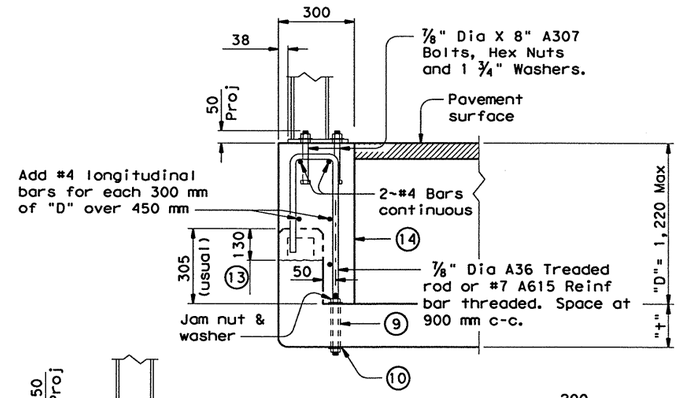


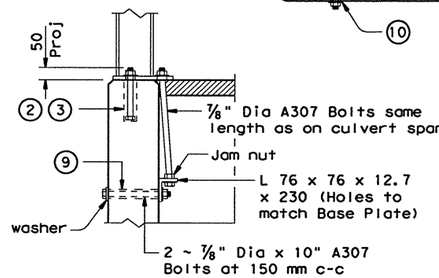


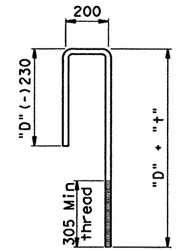
For other CGC overhangs with curbs, use details similar to others shown on this sheet.











7/8" Dia Threaded Rod
or 25M A615 Rebar

This sheet is intended to be used as a guide for retrofitting existing structures with the Type T6(M) traffic railing. Details with appropriate notes taken from this guide should be prepared for the specific application. Dimensions of existing slab thickness, curb widths, heights etc. should be shown. Particular care should be taken in identifying the bridge end abutment wingwall conditions, and providing for proper railing post anchorage and approach guard fence post positioning. This sheet may not be used without modification. The details shown may need to be amended if the exact condition existing is not covered. In all cases details and notes not required must be crossed out or eliminated, "(MOD)" added, the phrase "(Not to be used as a standard)" removed and the sheet sealed and signed.

GENERAL NOTES:
Designed according to current AASHTO Standard Specifications for Highway Bridges. Successfully evaluated by full-scale crash tests to meet NCHRP Report 230 criteria. These retrofit details are evaluated to have equivalent anchorage strength to the tested Type T6.

Not all possible combinations of existing railing, curbs, parapets, etc have been shown on this sheet. Other combinations and treatments are permissible if they meet the same strength and geometric requirements as indicated. Railing Type T6 must only be used on essentially curbless structures. Curbs and/or overlays up to 100 mm are permissible for special drainage control and other conditions, but should be avoided if possible.

See Traffic Rail Type T6(M) for details not shown hereon.

All reinforcing shall be Grade 420.

All dimensions are in millimeters unless otherwise noted.

Application shall be for BCS No. 3

(2) 7/8" Dia x 6" A307 Bolts grouted head down in 2" Dia hole.

(3) Optional 7/8" Dia anchorages with resin binder in capsules, or other two-component system may be used provided that a minimum ultimate tensile resistance of 123.2 kN per front anchor and 66.7 kN per rear anchor can be obtained. Hole size, hole cleaning and other installation requirements shall conform to manufacturer's recommendations. Field pull-out tests in accordance with ASTM E488 may be used to demonstrate pullout strength if permitted and/or required by the Engineer.

(9) Drill 1" - 1 1/8" Dia holes thru existing slab for 7/8" Dia bolts. Holes must be drilled with rotary or coring type equipment. Percussion or impact drilling shall not be used. Spalls in the bottom of the slab exceeding 13 mm from the edge of the holes shall be patched.

(10) Bottom Plate

(12) Maintain 1,905 mm post spacing wherever possible for use with nominal 7,620 mm standard rail section. Symmetry of post spacing is not necessary. A single 2,286 mm space followed by a single 1,524 mm space is acceptable where necessary to miss joints or culvert walls.

(13) Breakback existing curb, incorporate existing steel into new concrete.

(14) Cast continuous new curb or wall. (Class C or better.)

## NOTES

1. FOR HYDROLOGIC DATA, SEE RUNOFF COMPUTATION SHEET.
2. ALL DIMENSIONS ARE IN METERS UNLESS NOTED OTHERWISE.
3. FOR SUMMARIZATION OF ARMOR CURB SLOTS, SEE STORM DRAIN AND ARMOR CURB SUMMARY SHEET.
4. ALL ARMOR CURB OPENINGS SHALL HAVE AN ARMOR CURB FLUME CONSTRUCTED FROM BEHIND THE OPENING TO THE TOE OF SLOPE OF THE EMBANKMENT AND SHALL BE CONSIDERED SUBSIDIARY TO THE ARMORED CURB SLOT PAY ITEM.
5. SIDEWALK DRAINS SHALL BE PAID FOR AS AN ARMORED CURB SLOT.

* SUPPLIED FOR CONTRACTOR'S INFORMATION ONLY

NOTES:

1. ALL PIPES ARE NORMAL TO AND STRAIGHT FROM STRUCTURE TO STRUCTURE UNLESS OTHERWISE SHOWN ON INTERIOR DRAINAGE LAYOUTS
2. CONTRACTORS SHALL SHAPE INVERTS OF ALL PROPOSED CURB INLETS, DROP INLETS AND MANHOLES TO PRODUCE POSITIVE FLOW THROUGH STRUCTURE FROM ALL INLETS TO THE OUTLET OF EACH STRUCTURE.
3. CONTRACTOR SHALL INSTALL ALL STORM DRAIN PIPES INTO MANHOLES, BOXES AND EXISTING STRUCTURES FLUSH WITH INSIDE FACE AND GROUT INTO PLACE, INSURING WATERTIGHT SEAL ALL AROUND.
4. ALL STATION AND OFFSET INFORMATION IS REFERENCED TO THE ℄ LOOP 1604 UNLESS OTHERWISE NOTED.
5. CONTRACTOR SHALL CONSTRUCT MANHOLES TO MINIMIZE CONFLICT WITH UTILITIES.
6. SET (TY II) CONSTRUCTION SHALL UTILIZE RIPRAP HEADWALL (MOD) STANDARD SHEET.

# REFERS TO CHANGES MADE AS PART OF CHANGE ORDER.

NOTES:

1. ALL PIPES ARE NORMAL TO AND STRAIGHT FROM STRUCTURE TO STRUCTURE UNLESS OTHERWISE SHOWN ON INTERIOR DRAINAGE LAYOUTS
2. CONTRACTORS SHALL SHAPE INVERTS OF ALL PROPOSED CURB INLETS, DROP INLETS AND MANHOLES TO PRODUCE POSITIVE FLOW THROUGH STRUCTURE FROM ALL INLETS TO THE OUTLET OF EACH STRUCTURE.
3. CONTRACTOR SHALL INSTALL ALL STORM DRAIN PIPES INTO MANHOLES, BOXES AND EXISTING STRUCTURES FLUSH WITH INSIDE FACE AND GROUT INTO PLACE, INSURING WATERTIGHT SEAL ALL AROUND.
4. ALL STATION AND OFFSET INFORMATION IS REFERENCED TO THE ℄ LOOP 1604 UNLESS OTHERWISE NOTED.
5. CONTRACTOR SHALL CONSTRUCT MANHOLES TO MINIMIZE CONFLICT WITH UTILITIES.
6. SET(TY II) CONSTRUCTION SHALL UTILIZE RIPRAP HEADWALL (MOD) STANDARD SHEET.

**CHANGE ORDER NO. 64**
-REVISED MANHOLE DATA
-REVISED LINE I-28
-REVISED QUANTITIES

NOTES:

1. ALL PIPES ARE NORMAL TO AND STRAIGHT FROM STRUCTURE TO STRUCTURE UNLESS OTHERWISE SHOWN ON INTERIOR DRAINAGE LAYOUTS
2. CONTRACTORS SHALL SHAPE INVERTS OF ALL PROPOSED CURB INLETS, DROP INLETS AND MANHOLES TO PRODUCE POSITIVE FLOW THROUGH STRUCTURE FROM ALL INLETS TO THE OUTLET OF EACH STRUCTURE.
3. CONTRACTOR SHALL INSTALL ALL STORM DRAIN PIPES INTO MANHOLES, BOXES AND EXISTING STRUCTURES FLUSH WITH INSIDE FACE AND GROUT INTO PLACE, INSURING WATERTIGHT SEAL ALL AROUND.
4. ALL STATION AND OFFSET INFORMATION IS REFERENCED TO THE ℄ LOOP 1604 UNLESS OTHERWISE NOTED.
5. CONTRACTOR SHALL CONSTRUCT MANHOLES TO MINIMIZE CONFLICT WITH UTILITIES.
6. SET (TY II) CONSTRUCTION SHALL UTILIZE RIPRAP HEADWALL (MOD) STANDARD SHEET.

SECTION B-B

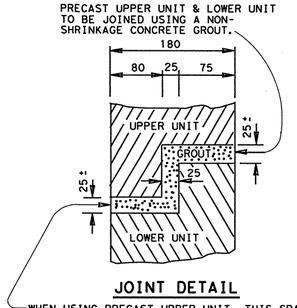
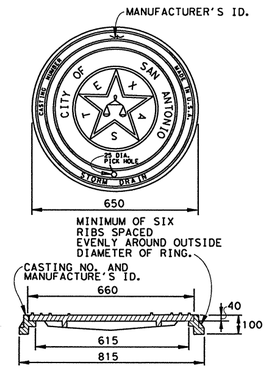
✳LOCATION OF STEPS WILL BE DETERMINED BY THE LOCATION OF RING & COVER.



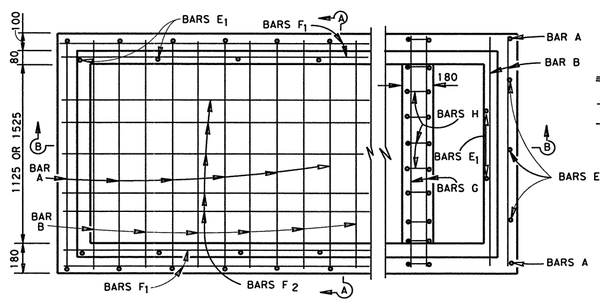
JOINT DETAIL

WHEN USING PRECAST UPPER UNIT, THIS SPACE IS FOR MAKING MINOR HORIZONTAL AND VERTICAL ADJUSTMENTS TO ACCOMODATE A FIT BETWEEN THE UPPER AND LOWER UNIT THAT ALLOWS FOR A MATCH LINE AND GRADE BETWEEN THE ROADWAY CURB AND THE UPPER UNIT OF THE INLET.

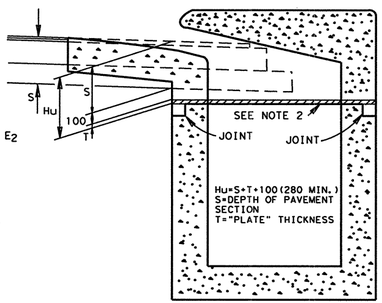


RING & COVER DETAIL

NOTE: FOR COVERS NOT ON SAN ANTONIO CITY STREETS, DELETE "CITY OF SAN ANTONIO & SCALES OF JUSTICE". MANHOLE RING AND COVER SHALL BE DESIGNED FOR HEAVY DUTY ROADWAY SERVICE AND SHALL INCLUDE A LOCKING DEVICE FOR THE COVER. THE LOAD BEARING SURFACE SHALL BE MACHINE GROUND.



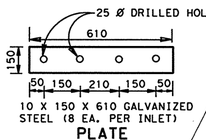
PLAN



PHASE CONSTRUCTION

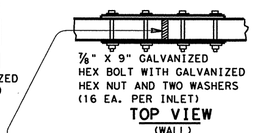
NOTES FOR PHASE CONSTRUCTION: (WHEN DIRECTED BY THE ENGINEER)

1. THE CURB INLET SHALL BE CONSTRUCTED TO A DEPTH "Hu" BELOW THE INLET GUTTER LINE ELEVATION.
2. CAP THE INLET WITH A STEEL PLATE APPROVED BY THE ENGINEER AND CONSTRUCT THE ROADWAY OVER THE PLATE.
3. AFTER THE RDWY. IS COMPLETED AND AFTER THE CURB IS PLACED (UP TO THE CONCRETE DEPRESSION) BUT PRIOR TO THE FINAL ACP, SAW CUT THE PAVEMENT, REMOVE THE PLATE AND COMPLETE THE UPPER PORTION OF THE CURB INLET.

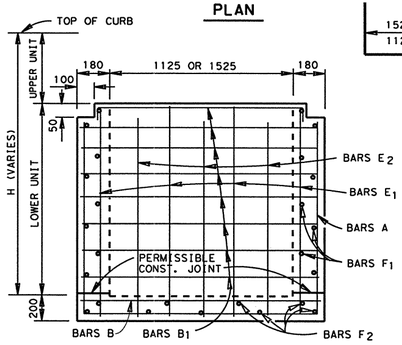


10 X 150 X 610 GALVANIZED STEEL (8 EA. PER INLET)

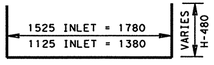
PLATE



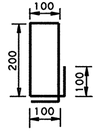
TOP VIEW (WALL)



SECTION A-A



BARS A



BAR H

## GENERAL NOTES:

ALL CONCRETE SHALL BE CLASS "A".
ALL DIMENSIONS FOR REINFORCING STEEL ARE TO CENTER OF BARS.
ALL REINFORCING STEEL SHALL HAVE A MINIMUM COVER OF 50.
QUANTITIES SHOWN ARE FOR CONTRACTORS INFORMATION ONLY.
BOLTS, NUTS, WASHERS AND PLATES SHALL BE GALVANIZED.
BOLTS, NUTS, WASHERS, PLATES AND GASKETS ARS SUBSIDIARY TO INLETS.
THE CONTRACTOR SHALL PROVIDE AN ADEQUATE MEANS TO LIFT AND PLACE THE INLETS, WHEN USING PRECAST UNITS.
ALL BARS AT PIPE BLOCKOUT LOCATIONS SHALL BE CUT OR BEND.
ALL LOWER UNITS SHALL RECEIVE INVERT MORTAR SHAPING.
PIPE BLOCKOUTS IN INLET WALLS SHALL NOT EXCEED 75 BEYOND THE OUTER SHELL OF THE PIPE, TAKING INTO ACCOUNT THE SKEW OF THE PIPE AS NECESSARY.
COMMERCIAL STEPS (APPROVED BY THE ENGINEER) SHALL BE PROVIDED AND INSTALLED IN INLETS WHERE "H" EXCEEDS 1200.
CONSTRUCTION JOINT MAY BE RAISED A MAXIMUM OF 150.

GENERAL NOTES:

ALL CONCRETE SHALL BE CL."A".

ALL DIMENSIONS RELATING TO REINFORCING STEEL ARE TO CENTER OF BARS.

ALL SIDES OF ARMOR CURB SLOT AND STUD ANCHORS SHALL BE 6 mm FILLET WELDS.

ALL EXPOSED STRUCTURAL STEEL (ARMOR) SHALL BE GALVANIZED.

ALL EXPOSED EDGES ON ARMOR CURB SHALL RECEIVE A 3 mm BEVEL.

THE SHAPE OF THE TYPICAL ROADWAY CURB SHALL TRANSITION TO THE ARMOR CURB AS APPROVED BY THE ENGINEER.

TRAFFIC GRATE TYPE 5

GENERAL NOTES :

ALL CONCRETE SHALL BE CLASS "C". COARSE AGGREGATE GRADE "4" MAY BE USED.
DIMENSIONS RELATING TO REINFORCING STEEL ARE TO CENTER OF BARS.
ALL EXPOSED CORNERS SHALL BE CHAMFERED 20.
QUANTITIES VARY WITH "H".
REINFORCING STEEL SHALL BE FIELD BENT OR CUT TO ALLOW FOR INSTALLATION OF PIPE(S).
PAYMENT FOR CONC., STEEL & GRATE SHALL BE INCLUDED IN UNIT COST OF ITEM 465 "MANHOLES & INLETS".
ALL DIMENSIONS ARE IN mm UNLESS SHOWN OTHERWISE.

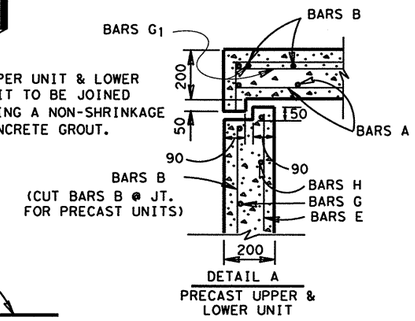
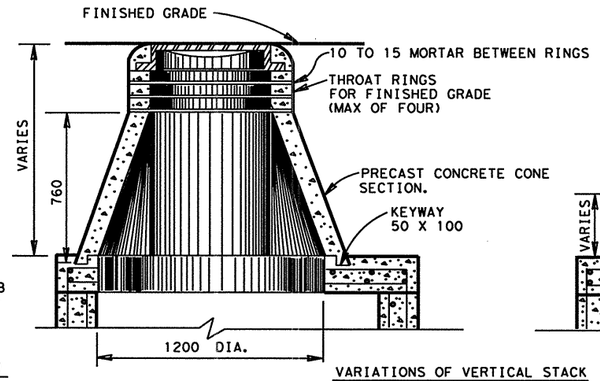
* QUANTITIES ARE FOR CONTRACTOR'S INFORMATION ONLY.
≠ CONCRETE QUANTITIES ALLOW FOR MANHOLE ACCESS BUT HAVE NOT BEEN DECREASED FOR DRAINAGE PIPES BECAUSE THE NUMBER AND SIZE VARY.



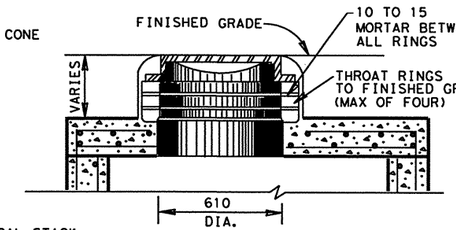
DETAIL A
PRECAST UPPER & LOWER UNIT

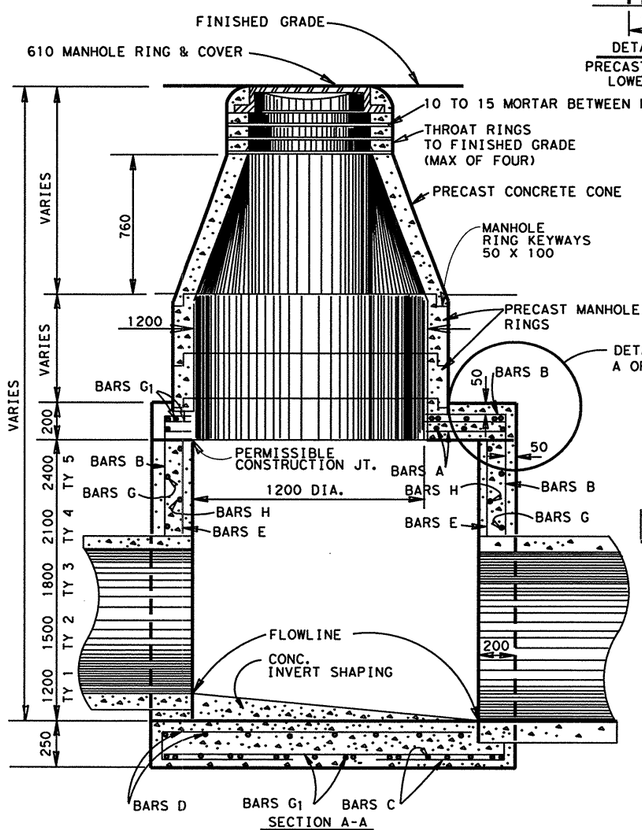
UPPER UNIT & LOWER UNIT TO BE JOINED USING A NON-SHRINKAGE CONCRETE GROUT.



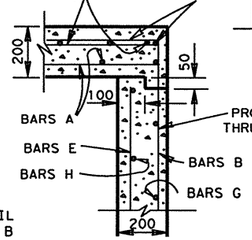
VARIATIONS OF VERTICAL STACK

VERTICAL STACK DESIGN SHALL BE GOVERNED BY THE DEPTH FROM THE TOP OF THE LOWER UNIT TO FINISHED GRADE.

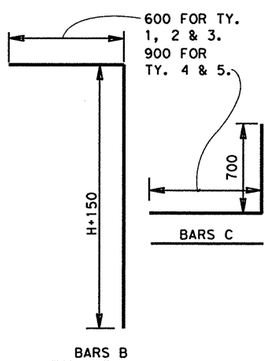


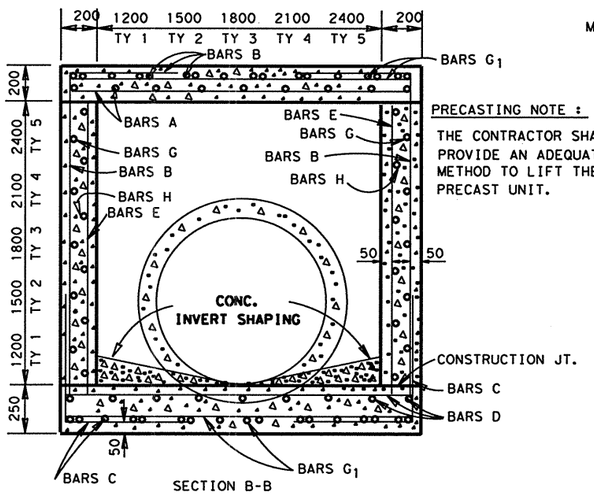


SECTION A-A



DETAIL B
CAST-IN-PLACE UPPER UNIT W/PRECAST LOWER UNIT

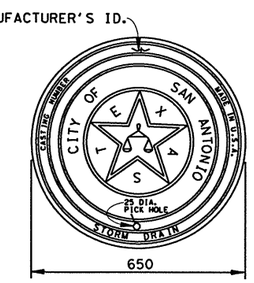




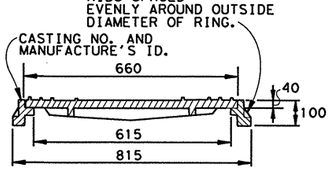
SECTION B-B

PRECASTING NOTE :

THE CONTRACTOR SHALL PROVIDE AN ADEQUATE METHOD TO LIFT THE PRECAST UNIT.



MINIMUM OF SIX RIBS SPACED EVENLY AROUND OUTSIDE DIAMETER OF RING.



GENERAL NOTES:

DIMENSIONS FOR REINFORCING STEEL ARE TO CENTER OF BARS.
ALL BARS INTERCEPTING MANHOLE AND PIPE OPENINGS SHALL BE FIELD CUT OR BEND.
WHEN THE MANHOLE IS CLOSE TO EXISTING UTILITIES, IT SHALL BE THE CONTRACTOR'S RESPONSIBILITY TO PROTECT AND MAINTAIN THESE LINES.

MANHOLE RING AND COVER SHALL BE DESIGNED FOR HEAVY DUTY ROADWAY SERVICE. THE COVER SHALL BE SECURED BY BOLTS OR A LOCKING DEVICE. FOR COVER NOT ON SAN ANTONIO CITY STREET, DELETE "CITY OF SAN ANTONIO & SCALES OF JUSTICE". THE LOAD BEARING SURFACE SHALL BE MACHINE GROUND.

THE NUMBER, SIZE AND LOCATION OF PIPES WILL VARY; SEE THE CULVERT SECTIONS.

ALL DIMENSIONS ARE IN mm UNLESS SHOWN OTHERWISE.

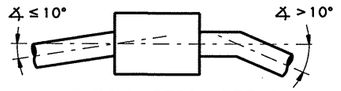
## RING AND COVER DETAILS (TYPE C)

Approximate Weight = 90 kg ③

③ Rings and covers of slightly different dimensions but approximately the same weight may be substituted if approved by the Engineer.



PIPE CONNECTION DETAIL

Connecting pipes should enter within 10° of normal to inlet wall. If necessary, pipe elbow or curved approach alignment should be used to stay within this limit.

### GENERAL NOTES:

Unless otherwise shown in the plans, payment will be made for each manhole of the Type M.

Exposed edges shall be chamfered 20 mm.

Alternate design drawings bearing the seal of a registered professional engineer will be acceptable for precast construction of the manholes.

Shop drawings will not be required.

The Contractor may with the approval of the Engineer furnish manholes of equivalent structural design.

In areas of conflict between reinforcing steel, blockouts, pipes, anchor bolts or other reinforcing steel, the reinforcement shall be bent or adjusted to clear as directed by the Engineer.

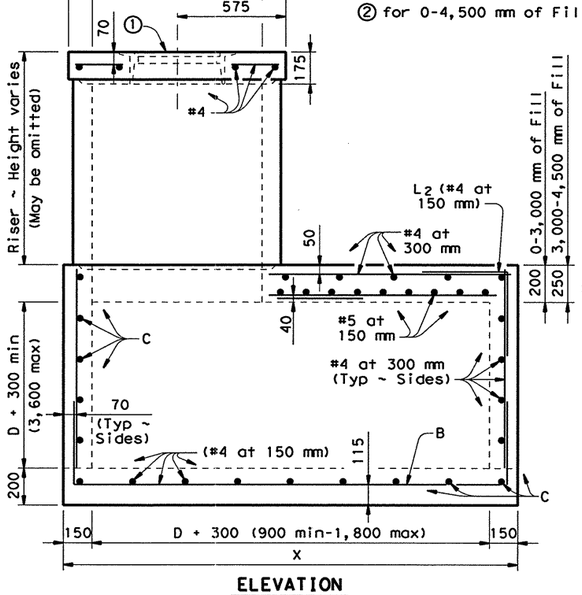
The riser may be constructed of reinforced concrete as shown or of Reinforced Concrete Pipe , Class III, in accordance with ASTM Designation C-76. If pipe is used, joints shall conform to the Item "Reinforced Concrete Pipe Culverts". Precast Concrete Lift Off Cover may be substituted for "Ring and Cover".

The riser, either cast-in-place or concrete pipe, may be located in any corner.

All reinforcing steel shall be #4 unless otherwise noted.

Pipes may enter any or all walls. The maximum size of pipe that can be accomodated is 1,500 mm. More than one pipe may enter a side, subject to the maximum box dimension shown. The clear distance between adjacent pipes should be 225 mm minimum.

All lengths are in millimeters and masses are in kilograms unless otherwise noted.



ELEVATION

D = maximum inside diameter of any Pipe entering the side shown or the opposite side

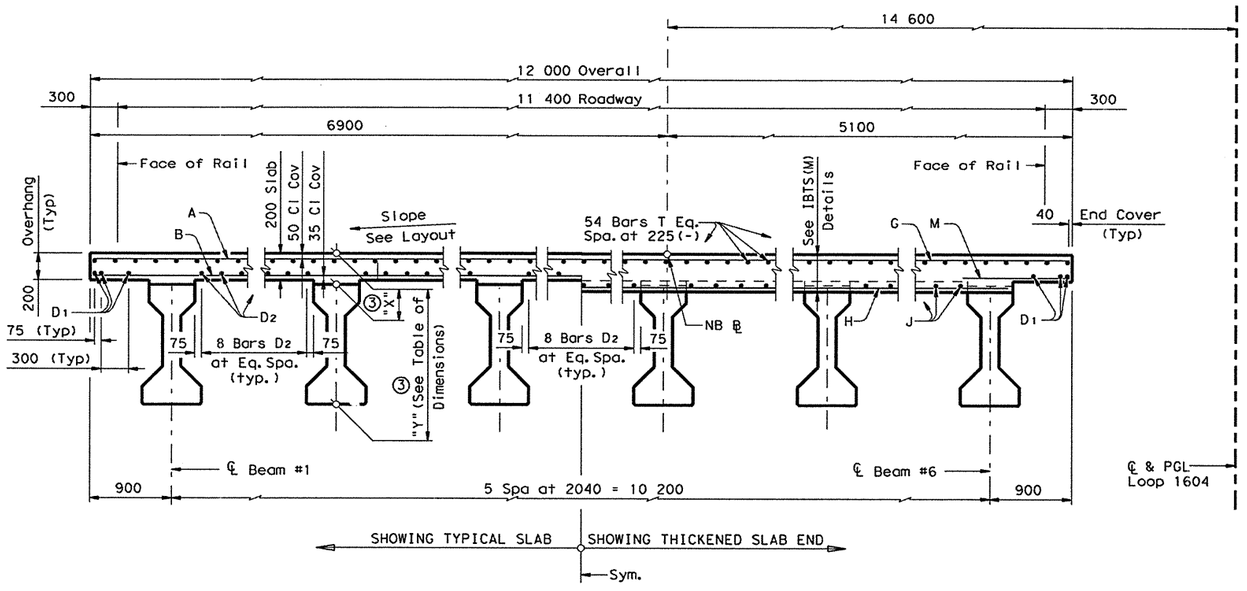
## UNITS 1 & 2 AND SPAN 8
## TYPICAL TRANSVERSE SECTION

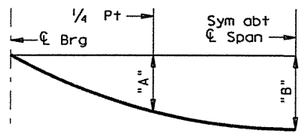
(LOOKING UPSTATION)



## SPAN 7
## TYPICAL TRANSVERSE SECTION

(LOOKING UPSTATION)

| Span | "A" | "B" |
|---|---|---|
| m | mm | mm |
| 34.900 | 41 | 58 |
| 36.800 | 39 | 54 |
| 23.000 | 8 | 11 |



## DEAD LOAD DEFLECTION DIAGRAM

NOTE: Deflections shown are due to concrete slab only. ($E_c$ = 35,000 MPa) Calculated deflections shown are theoretical and actual dimensions may be less. Deflections shall be adjusted based on field observations.

## BAR TABLE

| Bar | Size |
|---|---|
| A | #5 |
| B | #5 |
| D | #5 |
| G | #5 |
| H | #5 |
| J | #5 |
| M | #5 |
| T | #5 |

## TABLE OF ESTIMATED QUANTITIES

| Unit | Reinf Concrete Slab | Prestressed Concrete ① Beams (Ty IV) | Class "S" Concrete | ②Total Reinf Steel |
|---|---|---|---|---|
| | $m^2$ | m | $m^3$ | kg |
| 1 | 1256.4 | 522.0 | 255.2 | 40,205 |
| 2 | 1256.4 | 522.0 | 255.2 | 40,205 |
| 3 | 717.6 | 334.7 | 146.1 | 22,963 |

① Fabricator shall adjust beam lengths for beam slopes as required.

② Reinforcing steel mass is calculated using an approximate factor of 32 kg/$m^2$.

## ③ TABLE OF DIMENSIONS (mm)

| | X | Y |
|---|---|---|
| Abut 1 Front | 255 | 1627 |
| Middle Span 1 | 212 | 1584 |
| Bent 2 Back | 255 | 1627 |
| Bent 2 Front | 255 | 1627 |
| Middle Span 2 | 244 | 1616 |
| Bent 3 Back | 255 | 1627 |

X= 255, Y= 1627 unless otherwise specified in above table.

**GENERAL NOTES:**

1. Designed according to current AASHTO Standard and Interim Specifications.
2. See IBTS(M) Standard for Thickened Slab End Details and quantity adjustments.
3. See PCP(C)(M) or PMDF(C)(M) Standards for details and quantity adjustments if either of these options are used.
4. All reinforcing shall be Grade 420. Concrete strength f'c = 28 MPa.
5. All dimensions are in millimeters unless otherwise shown.
6. Bar laps, where required, shall be as follows:
   Uncoated ~ #5 = 560 mm

The bonding agent shall be mixed with the mortar in accordance with the manufacturer's recommendations.

### GENERAL NOTES:

1. All cap and column concrete shall be Class "C", fc'= 25 MPa.
2. All cap and column reinforcing shall be Grade 420.
3. See layout for drilled shaft length.
4. Calculated drilled shaft load = 2290 kN Each.
5. All dimensions are in millimeters unless otherwise specified.
6. Chamfer all exposed corners 20mm unless otherwise specified.

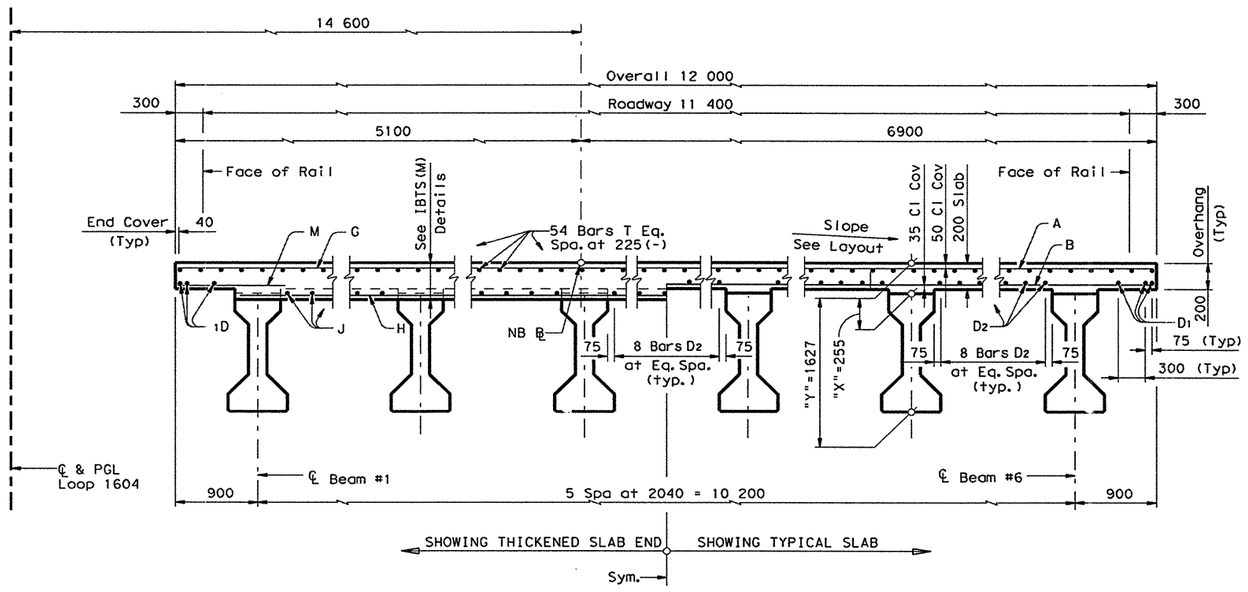
## UNITS 1 & 2 AND SPAN 8
## TYPICAL TRANSVERSE SECTION

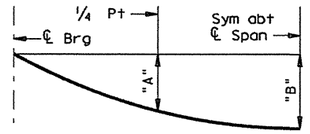
(LOOKING UPSTATION)



## SPAN 7
## TYPICAL TRANSVERSE SECTION

(LOOKING UPSTATION)

| Span | "A" | "B" |
|---|---|---|
| m | mm | mm |
| 34.900 | 41 | 58 |
| 36.800 | 39 | 54 |
| 23.000 | 8 | 11 |



## DEAD LOAD DEFLECTION DIAGRAM

NOTE: Deflections shown are due to concrete slab only. ($E_c$ = 35,000 MPa) Calculated deflections shown are theoretical and actual dimensions may be less. Deflections shall be adjusted based on field observations.

## BAR TABLE

| Bar | Size |
|---|---|
| A | #5 |
| B | #5 |
| D | #5 |
| G | #5 |
| H | #5 |
| J | #5 |
| M | #5 |
| T | #5 |

## TABLE OF ESTIMATED QUANTITIES

| Unit | Reinf Concrete Slab | Prestressed Concrete ① Beams (Ty IV) | Class "S" Concrete | ②Total Reinf Steel |
|---|---|---|---|---|
| | $m^2$ | m | $m^3$ | kg |
| 1 | 1256.4 | 522.0 | 255.2 | 40,205 |
| 2 | 1256.4 | 522.0 | 255.2 | 40,205 |
| 3 | 717.6 | 334.7 | 146.1 | 22,963 |

① Fabricator shall adjust beam lengths for beam slopes as required.

② Reinforcing steel mass is calculated using an approximate factor of 32 kg/$m^2$.

**GENERAL NOTES:**

1. Designed according to current AASHTO Standard and Interim Specifications.
2. See IBTS(M) Standard for Thickened Slab End Details and quantity adjustments.
3. See PCP(C)(M) or PMDF(C)(M) Standards for details and quantity adjustments if either of these options are used.
4. All reinforcing shall be Grade 420. Concrete strength f'c = 28 MPa.
5. All dimensions are in millimeters unless otherwise shown.
6. Bar laps, where required, shall be as follows:
   Uncoated ~ #5 = 560 mm

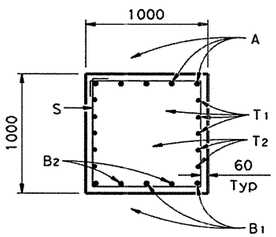
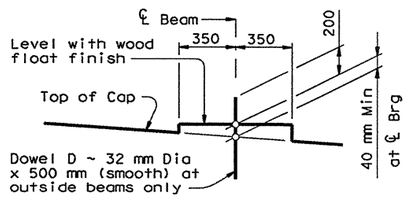
## HALF ELEVATION

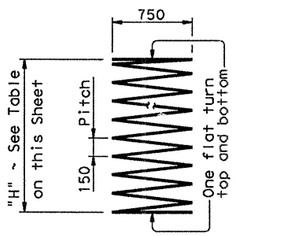


## SECTION A-A

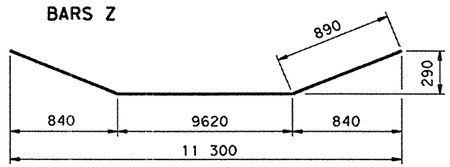


## BEARING SEAT DETAIL

(Bearing surface shall be clean and free of all loose material before placing bearing pad.)



BARS Z



BARS B1

NOTE: Built up portion of bearing seat shall be cast integrally with cap or constructed as follows. Area under built up portion to be bush hammered. Then pedestal shall be formed from mortar which has been treated with doraweld or weldcrete bonding agent or an approved equal. The bonding agent shall be mixed with the mortar in accordance with the manufacturer's recommendations.

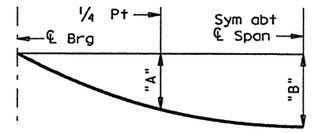
## TYPICAL TRANSVERSE SECTION

(LOOKING UPSTATION)

| Span | "A" | "B" |
|---|---|---|
| m | mm | mm |
| 33.500 | 33 | 46 |



## DEAD LOAD DEFLECTION DIAGRAM

NOTE: Deflections shown are due to concrete slab only. ($E_c$ = 35,000 MPa) Calculated deflections shown are theoretical and actual dimensions may be less. Deflections shall be adjusted based on field observations.

## BAR TABLE

| BAR | SIZE |
|---|---|
| A | #5 |
| B | #5 |
| D | #5 |
| G | #5 |
| H | #5 |
| J | #5 |
| M | #5 |
| T | #5 |

## TABLE OF ESTIMATED QUANTITIES

| REINF CONCRETE SLAB | PRESTRESSED CONCRETE ① BEAMS (TY IV) | CLASS "S" CONCRETE | ②TOTAL REINF STEEL |
|---|---|---|---|
| $m^2$ | m | $m^3$ | kg |
| 1869.3 | 801.6 | 380.3 | 59,818 |

① Fabricator shall adjust beam lengths for beam slopes as required.

② Reinforcing steel mass is calculated using an approximate factor of 32 kg/$m^2$.

**GENERAL NOTES:**

1. Designed according to current AASHTO Standard and Interim Specifications.
2. See IBTS(M) Standard for Thickened Slab End Details and quantity adjustments.
3. See PCP(C)(M) or PMDF(C)(M) Standards for details and quantity adjustments if either of these options are used.
4. All reinforcing shall be Grade 420. Concrete strength f'c = 28 MPa.
5. All dimensions are in millimeters unless otherwise shown.
6. Bar laps, where required, shall be as follows:
   Uncoated ~ #5 = 560 mm

## BEARING SEAT DETAIL

(Bearing surface shall be clean and free of all loose material before placing bearing pad.)

NOTE: Built up portion of bearing seat shall be cast integrally with cap or constructed as follows. Area under built up portion to be bush hammered. Then pedestal shall be formed from mortar which has been treated with doraweld or weldcrete bonding agent or an approved equal. The bonding agent shall be mixed with the mortar in accordance with the manufacturer's recommendations.

| | | | | |
| *Reinforcing Steel | | | kg | 2236 |
| Class "C" Concrete | | | $m^3$ | 26.9 |
| | | | | |

*For Contractors Information Only

1. Increase as required to maintain 90 mm from Finished Grade.
2. See Slab Typ. Section sheet for "Y".

### GENERAL NOTES:

1. All cap and backwall concrete shall be Class "C", f'c = 25 MPa.
2. All cap and wall reinforcing shall be Grade 420.
3. See Foundation Detail Standard Sheet, FD(M), for all foundation details and notes.
4. Calculated Drilled Shaft Load = 1023 kN each.
5. All dimensions are in millimeters unless otherwise specified.
6. Chamfer an exposed corner 20mm unless otherwise specified.

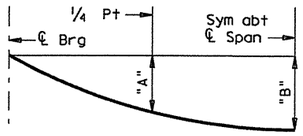
## TYPICAL TRANSVERSE SECTION

(LOOKING UPSTATION)

| Span | "A" | "B" |
|---|---|---|
| m | mm | mm |
| 33.200 | 34 | 48 |



## DEAD LOAD DEFLECTION DIAGRAM

NOTE: Deflections shown are due to concrete slab only. ($E_c$ = 35,000 MPa) Calculated deflections shown are theoretical and actual dimensions may be less. Deflections shall be adjusted based on field observations.

## BAR TABLE

| Bar | Size |
|---|---|
| A | #5 |
| B | #5 |
| D | #5 |
| G | #5 |
| H | #5 |
| J | #5 |
| M | #5 |
| T | #5 |

## TABLE OF ESTIMATED QUANTITIES

| Reinf Concrete Slab | Prestressed Concrete ① Beams (Ty IV) | Class "S" Concrete | ②Total Reinf Steel |
|---|---|---|---|
| $m^2$ | m | $m^3$ | kg |
| 2211.1 | 893.7 | 450.2 | 70,755 |

① Fabricator shall adjust beam lengths for beam slopes as required.

② Reinforcing steel mass is calculated using an approximate factor of 32 kg/$m^2$.

### GENERAL NOTES:

1. Designed according to current AASHTO Standard and Interim Specifications.
2. See IBTS(M) Standard for Thickened Slab End Details and quantity adjustments.
3. See PCP(C)(M) or PMDF(C)(M) Standards for details and quantity adjustments if either of these options are used.
4. All reinforcing shall be Grade 420. Concrete strength f'c = 28 MPa.
5. All dimensions are in millimeters unless otherwise shown.
6. Bar laps, where required, shall be as follows:
   Uncoated ~ #5 = 560 mm

| | | | | |
| *Reinforcing Steel | | | kg | 2744 |
| Class "C" Concrete | | | $m^3$ | 31.5 |

*For Contractors Information Only
**Including one lap length
Lap Length: A=3220
H=420

(1) Increase as required to maintain 90 mm from Finished Grade.
(2) See Slab Typ. Section sheet for "Y".

### GENERAL NOTES:

1. All cap and backwall concrete shall be Class "C", f'c = 25 MPa.
2. All cap and wall reinforcing shall be Grade 420.
3. See Foundation Detail Standard Sheet, FD(M), for all foundation details and notes.
4. Calculated Drilled Shaft Load = 988 kN each.
5. All dimensions are in millimeters unless otherwise specified.
6. Chamfer an exposed corner 20mm unless otherwise specified.

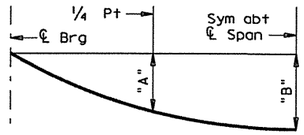
## TYPICAL TRANSVERSE SECTION

(LOOKING UPSTATION)

| Span | "A" | "B" |
|---|---|---|
| m | mm | mm |
| 29.000 | 17 | 25 |



## DEAD LOAD DEFLECTION DIAGRAM

NOTE: Deflections shown are due to concrete slab only. ($E_c$ = 35,000 MPa) Calculated deflections shown are theoretical and actual dimensions may be less. Deflections shall be adjusted based on field observations.

## BAR TABLE

| Bar | Size |
|---|---|
| A | #5 |
| B | #5 |
| D | #5 |
| G | #5 |
| H | #5 |
| J | #5 |
| M | #5 |
| T | #5 |

## TABLE OF ESTIMATED QUANTITIES

| Reinf Concrete Slab | Prestressed Concrete ① Beams (Ty. IV) | Class "S" Concrete | ② Total Reinf Steel |
|---|---|---|---|
| $m^2$ | m | $m^3$ | kg |
| 1148.4 | 520.2 | 234.3 | 36,749 |

① Fabricator shall adjust beam lengths for beam slopes as required.

② Reinforcing steel mass is calculated using an approximate factor of 32 kg/$m^2$.

## ③ TABLE OF DIMENSIONS

| | X | Y |
|---|---|---|
| Abut 1 Front | 255 | 1627 |
| Middle Span 1 | 220 | 1592 |
| Bent 2 Back | 255 | 1627 |
| Bent 2 Front | 255 | 1627 |
| Middle Span 2 | 220 | 1592 |
| Bent 3 Back | 255 | 1627 |
| Bent 3 Front | 255 | 1627 |
| Middle Span 3 | 236 | 1608 |
| Abut 4 Back | 255 | 1627 |

**GENERAL NOTES:**

1. Designed according to current AASHTO Standard and Interim Specifications.
2. See IBTS(M) Standard for Thickened Slab End Details and quantity adjustments.
3. See PCP(C)(M) or PMDF(C)(M) Standards for details and quantity adjustments if either of these options are used.
4. All reinforcing shall be Grade 420. Concrete strength f'c = 28 MPa.
5. All dimensions are in millimeters unless otherwise shown.
6. Bar laps, where required, shall be as follows:
   Uncoated ~ #5 = 560 mm

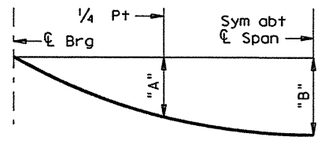
## TYPICAL TRANSVERSE SECTION

(LOOKING UPSTATION)

| Span | "A" | "B" |
|---|---|---|
| m | mm | mm |
| 28.500 | 17 | 24 |



## DEAD LOAD DEFLECTION DIAGRAM

NOTE: Deflections shown are due to concrete slab only. ($E_c$ = 35,000 MPa) Calculated deflections shown are theoretical and actual dimensions may be less. Deflections shall be adjusted based on field observations.

## BAR TABLE

| Bar | Size |
|---|---|
| A | #5 |
| B | #5 |
| D | #5 |
| G | #5 |
| H | #5 |
| J | #5 |
| M | #5 |
| T | #5 |

## TABLE OF ESTIMATED QUANTITIES

| Reinf Concrete Slab | Prestressed Concrete ① Beams (Ty IV) | Class "S" Concrete | ②Total Reinf Steel |
|---|---|---|---|
| $m^2$ | m | $m^3$ | kg |
| 1179.9 | 511.2 | 240.8 | 37,757 |

① Fabricator shall adjust beam lengths for beam slopes as required.

② Reinforcing steel mass is calculated using an approximate factor of 32 kg/$m^2$.

## ③ TABLE OF DIMENSIONS

| | X | Y |
|---|---|---|
| Abut 1 Front | 255 | 1627 |
| Middle Span 1 | 223 | 1595 |
| Bent 2 Back | 255 | 1627 |
| Bent 2 Front | 255 | 1627 |
| Middle Span 2 | 226 | 1598 |
| Bent 3 Back | 255 | 1627 |
| Bent 3 Front | 255 | 1627 |
| Middle Span 3 | 238 | 1610 |
| Abut 4 Back | 255 | 1627 |

**GENERAL NOTES:**

1. Designed according to current AASHTO Standard and Interim Specifications.
2. See IBTS(M) Standard for Thickened Slab End Details and quantity adjustments.
3. See PCP(C)(M) or PMDF(C)(M) Standards for details and quantity adjustments if either of these options are used.
4. All reinforcing shall be Grade 420. Concrete strength f'c = 28 MPa.
5. All dimensions are in millimeters unless otherwise shown.
6. Bar laps, where required, shall be as follows:
   Uncoated ~ #5 = 560 mm

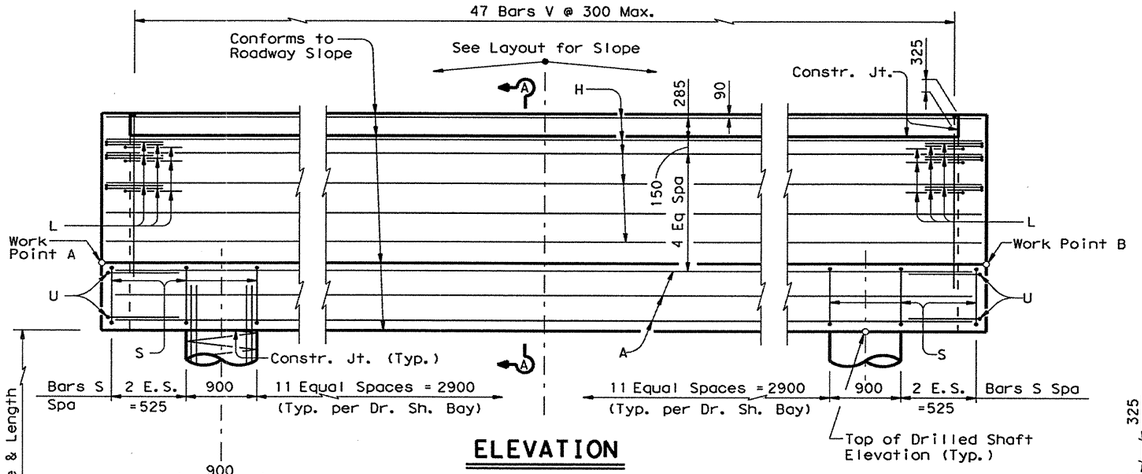
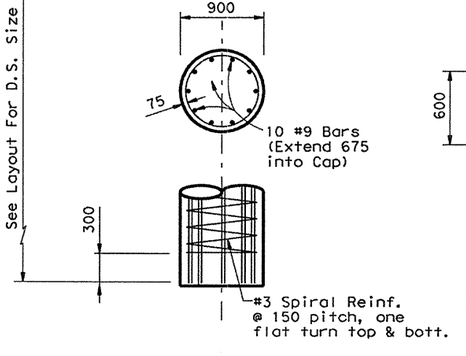
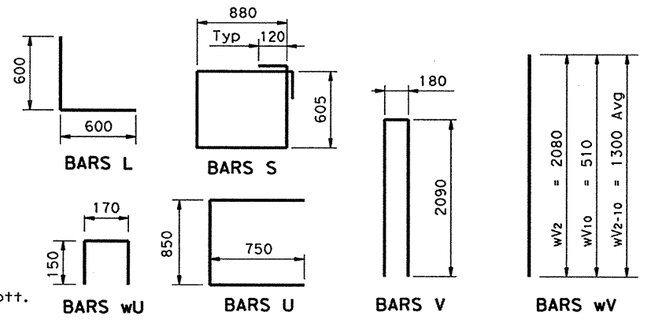
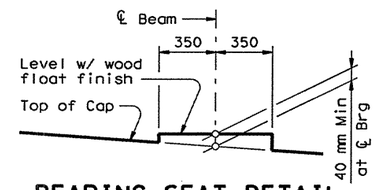
## PLAN



## ELEVATION







## BEARING SEAT DETAIL

(Bearing surface shall be clean and free of all loose material before placing bearing pad.)

NOTE: Built up portion of bearing seat shall be cast integrally with cap or constructed as follows. Area under built up portion to be bush hammered. Then pedestal shall be formed from mortar which has been treated with doraweld or weldcrete bonding agent or an approved equal. The bonding agent shall be mixed with the mortar in accordance with the manufacturer's recommendations.

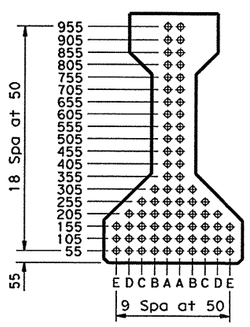
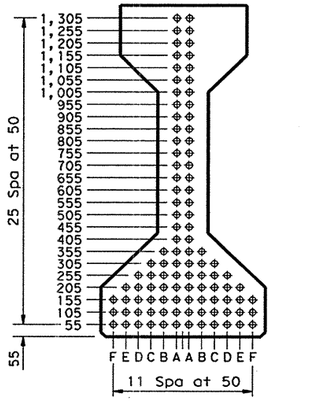
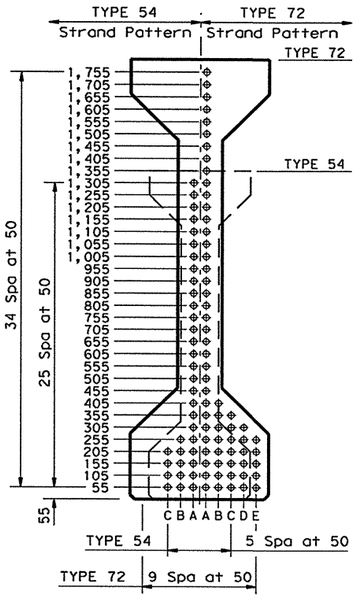
TYPE A & TYPE B BMS



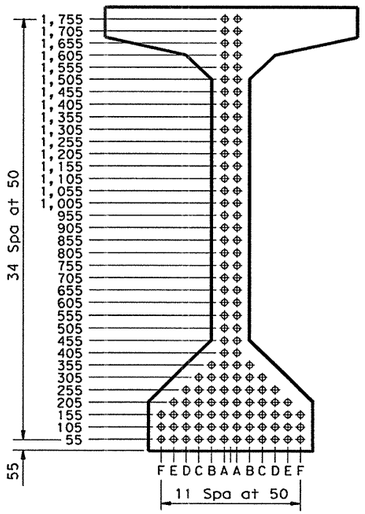
TYPE C BM



TYPE IV BM
(AASHTO TYPE IV BM)



TYPE 54 & TYPE 72 BMS



TYPE VIM BM
(AASHTO TYPE VI (MOD) BM)

GENERAL NOTES:

Designed in accordance with current AASHTO Standard Specifications.

All concrete shall be Class H. All reinforcing bars shall be Grade 420.

When shown on this sheet, the Fabricator has the option of furnishing either the designed depressed strand beam or an approved optional design. All optional design submittals and shop drawings shall be signed, sealed and dated by a registered Professional Engineer.

Optional designs for beams 36,000 mm or longer shall have a calculated residual camber equal to or greater than that of the designed beam.

Prestress losses for the designed beams have been calculated for a relative humidity of 75 percent. Optional designs shall likewise conform.

Certain beams with depressed strands are subject to cracking in the end of the beam. When such cracks occur, all subsequent beams of the same type and strand pattern shall have strands debonded in the following manner:

1. Alternate rows of depressed strands shall be debonded for 600 mm from each end of the beam.
2. One half of the straight strands, as nearly as possible, shall be debonded for 1,200 mm from each end of the beam.
3. The debonding pattern shall be symmetrical about the vertical axis of the beam for both depressed and straight strands.
4. Strands shall be debonded so that the centers of gravity of the depressed strands and the straight strands will remain within 25 mm of their original location.
5. Strands shall be encased in plastic tubing along entire debonded length, and ends of tubing shall be sealed with waterproof tape. Split plastic tubing may be used provided the seam of the tubing is sufficiently sealed with waterproof tape to prohibit grout infiltration. Wrapping of strands with tape to provide debonding will not be permitted.
6. Revised shop drawings will not be required.

For depressed strand designed beams, strands shall be located as low as possible on the 50 mm grid system unless a Non-Standard Strand Pattern is indicated. Fill row "55", then row "105", then row "155", etc., beginning each row in the "A" position and working outward until the required number of strands is reached. All strands in the "A" position shall be depressed, maintaining the 50 mm spacing so that, at the beam ends, the upper two strands are in the position shown in the table.

Strands for the designed beam shall be 13 mm 1860 MPa low relaxation strands pretensioned to 138 kN each.

Type 54 Beams shall not be used for new structures, but may be used to widen existing bridges built with Type 54 Beams.

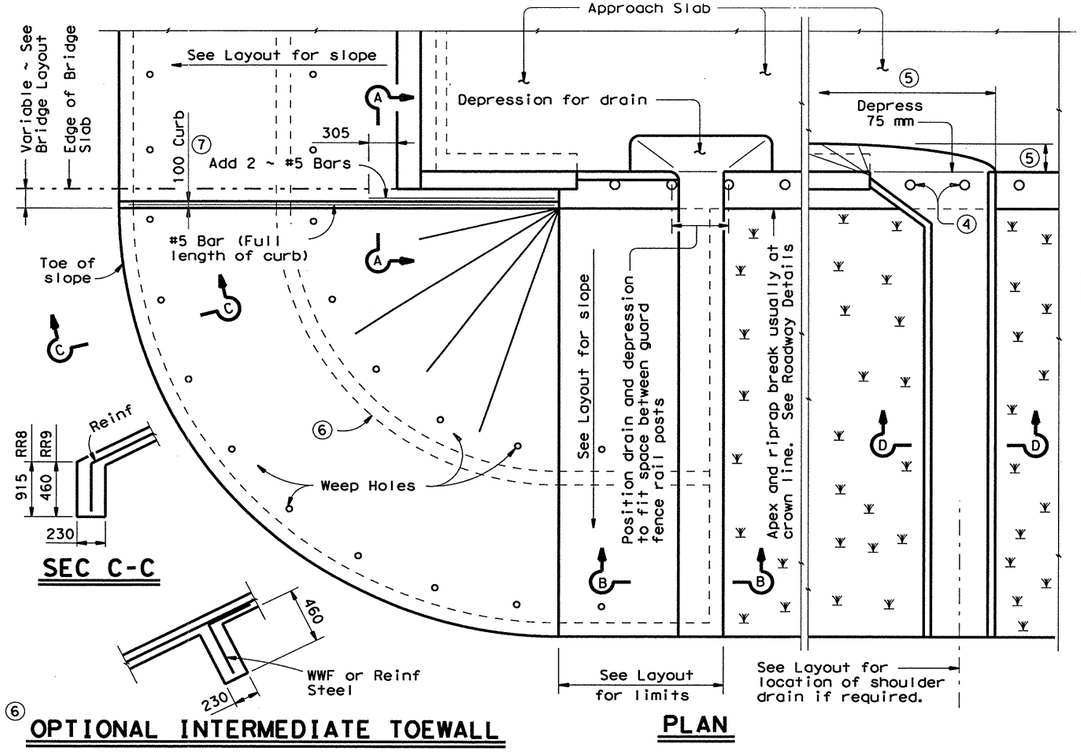
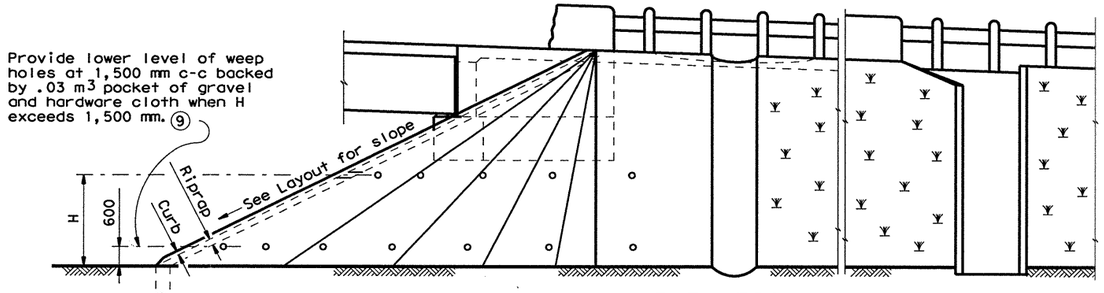
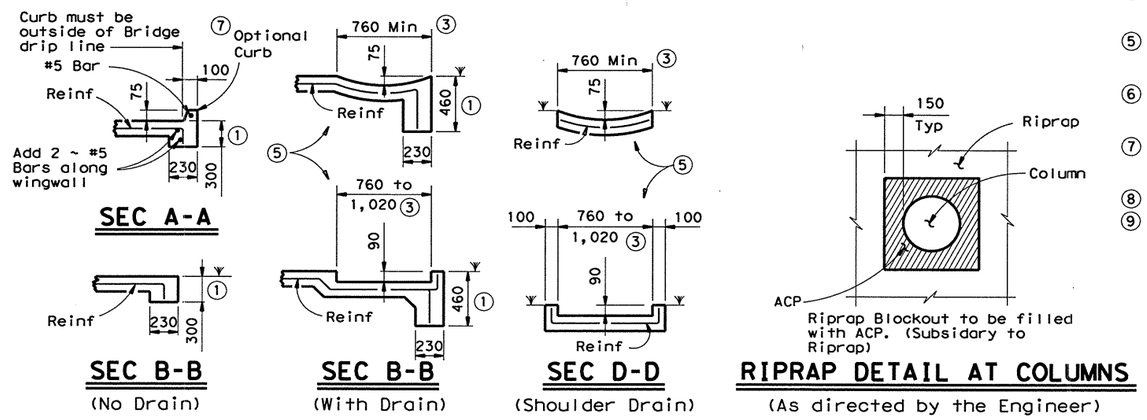
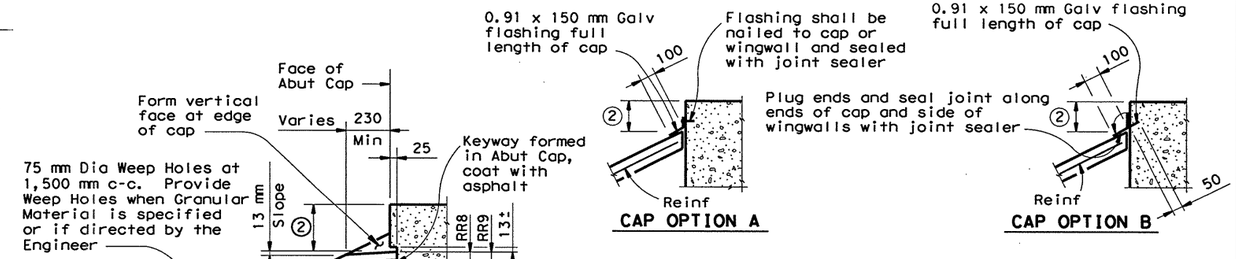
DISCLAIMER:
The use of this standard is governed by the "Texas Engineering Practice Act". No warranty of any kind is made by TxDOT for any purpose whatsoever. TxDOT assumes no responsibility for the conversion of this standard to other formats or for incorrect results or damages resulting from its use.



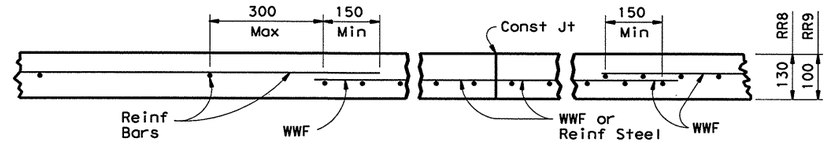






Note: The sealing option of the joint between the face of cap and riprap shall be as designated by the Engineer or as shown elsewhere on plans.

Note: Flashing (shown in Cap Option A) may be used at wingwall in addition to Exp Jt Mat'l if shown on plans or directed by the Engineer.



Note: Reinforcing bars shall be #3 at 450 mm spac c-c. Welded wire fabric shall be 152 x 152 - MW19 x MW19. Combinations of WWF and reinforcing bars may be used if both are permitted. Lap splices shall be a minimum of 150 mm, measured from the transverse wire of WWF, and the ends of reinforcing bars.

## DETAILS OF WWF, REINF AND CONST JOINT

1. Wall extension may be reduced or modified if approved by the Engineer. Wall extension shall be increased to 460 mm whenever the optional Intermediate Toewall is called for in the plans.
2. Top of cap to top of riprap dimension varies as directed by the Engineer. Should be 230 mm Min for stringer type bridges and 460 mm for slab type bridges.
3. Wider or other drain configurations shall be used if shown elsewhere in plans or if directed by the Engineer.
4. A 300 mm Dia void should be provided in the riprap at the guard fence location. Backfill with 100 mm of ACP if directed by the Engineer.
5. Limits and configuration of drains and depressions shall be as shown elsewhere in plans or as directed by the Engineer.
6. The optional Intermediate toe wall shall be constructed when designated elsewhere in the plans or included in the specifications.
7. When riprap is shown extended around header on layout, extend slab and toewall as shown and eliminate 100 mm curb.
8. 1.21 x 200 mm Galv Sheet Metal
9. If erodable soils occur in the embankment

FOR CONTRACTOR'S INFORMATION ONLY:
130 mm of RR8 = .130 $m^3/m^2$
100 mm of RR9 = .100 $m^3/m^2$
#3 Reinf at 450 mm c-c = 2.49 $kg/m^2$
152 x 152 - MW19 x MW19 = 2.05 $kg/m^2$

GENERAL NOTES

Concrete shall be Class B unless noted elsewhere in plans.

Reinforcing other than that shown may be used by substituting reinforcement of equal or greater unit cross-sectional area. The Maximum reinforcement spacing shall be 450 mm.

Construction joints or grooved joints extending the full slant slope height shall be at intervals of approximately 6,000 mm unless otherwise directed by the Engineer.

Porous Concrete Filter Blanket and Gravel Backfill shall be placed if shown elsewhere in the plans or if directed by the Engineer.

Hardware cloth, loose graded stone behind weep holes, flashing, or other sealing material shall not be paid for directly but shall be subsidiary to the bid item, Riprap.

Unless specified elsewhere in the plans to be only reinforcing bars, the riprap reinforcing may be composed of reinforcing bars, welded wire fabric, or any suitable combination of both types.

See Layout for limits of riprap.
RR8 is to be used on stream crossings.
RR9 is to be used on other embankments.
All dimensions are in millimeters unless otherwise shown.

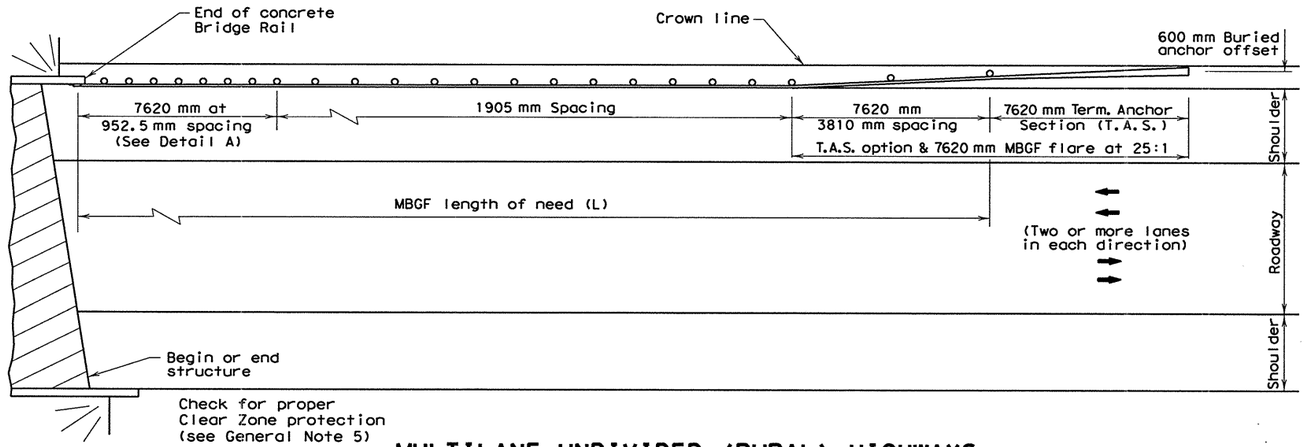
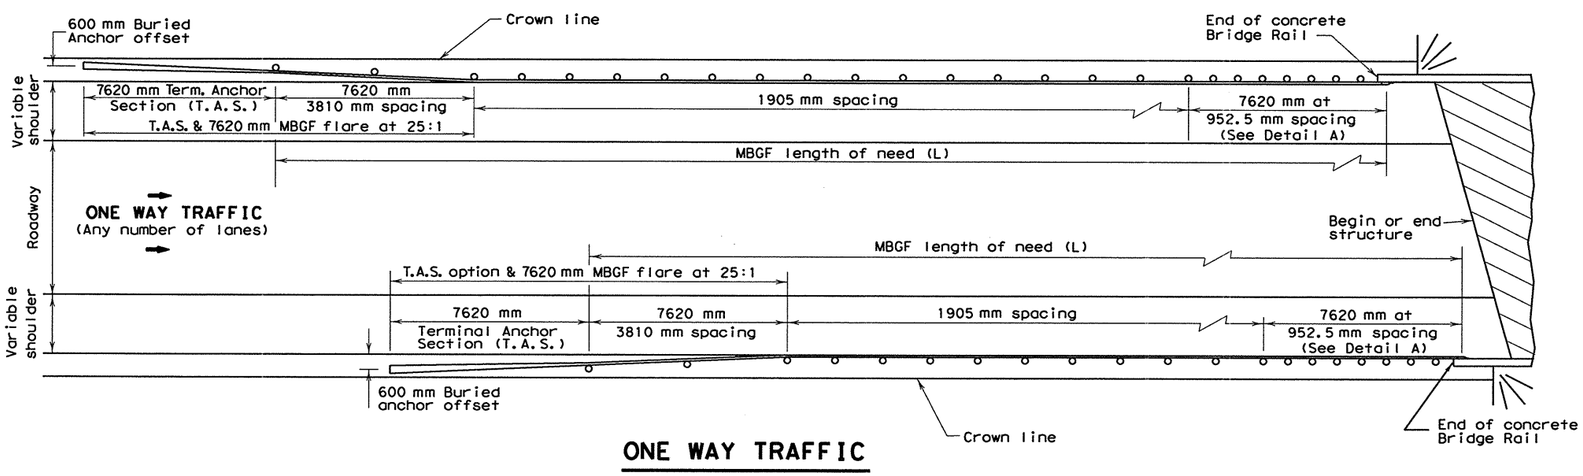
## TWO LANE (RURAL) HIGHWAYS



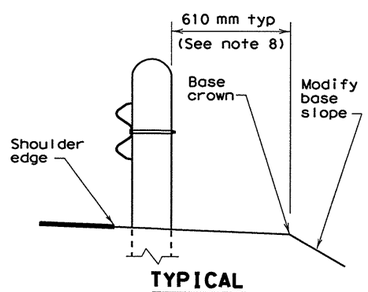
## MULTILANE UNDIVIDED (RURAL) HIGHWAYS



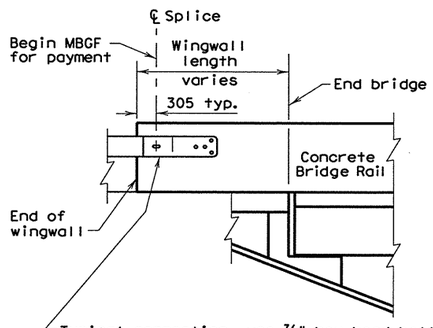
## ONE WAY TRAFFIC

## GENERAL NOTES

1. For metal beam guard fence details, see MBGF plan sheet.
2. Quantities of metal beam guard fence (MBGF) at individual bridge ends are shown elsewhere in plans.
3. Use average daily traffic (ADT) for the current year to determine MBGF length of need in accordance with the Operations and Procedures (Design) Manual unless otherwise specified. Where significant traffic volume growth is anticipated on low volume (0-750 ADT) highways use length determinations for the higher volume category.
4. Where length (L) of MBGF used is 15,240 mm, post spacing shall be as detailed hereon (See plan layout for two lane (rural) highways, left side of traffic approaching bridge). Where length (L) of MBGF is 22,860 mm or more, post spacing shall be 952.5 mm for the 7620 mm section adjacent to the bridge, 3810 mm for the 7620 mm section ajacent to the T.A.S., and 1905 mm for the remaining intervening length. When T6 bridge rail is used, the min. MBGF post spacing shall be 1905 mm.
5. MBGF may not be required to shield departure end of bridge unless other hazards within the clear zone warrant MBGF. Where installed on the departure end, 1905 mm post spacing is acceptable throughout the placement length including adjacent to bridge end.
6. When specified, the T.A.S. and typically adjacent 7620 mm MBGF should be flared from the shoulder edge at 25:1 (longitudinal:lateral) to provide a 600 mm usual offset to buried anchor.
7. When end treatments other than T.A.S. are used, post spacing shall be 952.5 mm for the 7620 mm section adjacent to the bridge and 1905 mm for the remaining length of need. See the end treatment detail sheet(s) for additional information.
8. The crown will be widened to accommodate MBGF. Typically the crown line should be 610 mm from the back of the MBGF post. This applies to new construction on new alignment or where existing roadway cross section is to be widened to increase roadway width. This does not apply to rehabilitation work where existing roadway crown width is to be retained (See Typical Cross Section).
9. For restrictive width bridges, a 7620 mm tangent section of MBGF should connect to the wingwall. The adjoining MBGF that lies within the roadway (Lanes & Shoulder area) crown should be flared at the rate of 25:1 (Longitudinal : Lateral). Length at these bridges should be determined as stated above or the length necessary to locate the buried anchor at a 600 mm offset from shoulder edge, whichever is greater.
10. Variations in post spacings and/or the use of spacer blocks or shims may be required by the Engineer in order to accommodate the required rail connection to existing structures.



**TYPICAL CROSS SECTION**



Typical connection, use 7/8" hex head bolts with washers under nut and bolt head (See Bridge Rail or other plansheets for details of MBGF to Bridge Rail connection).

**DETAIL A**

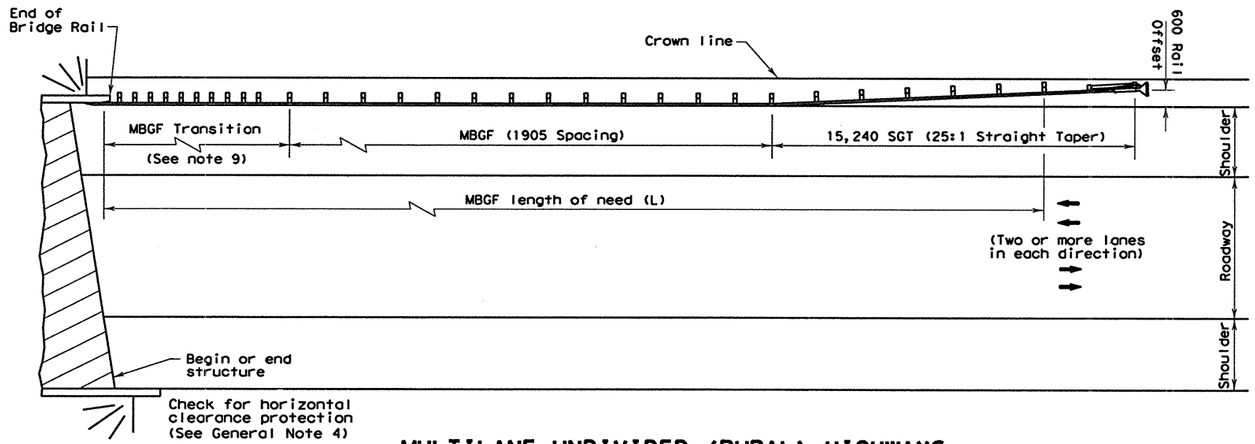
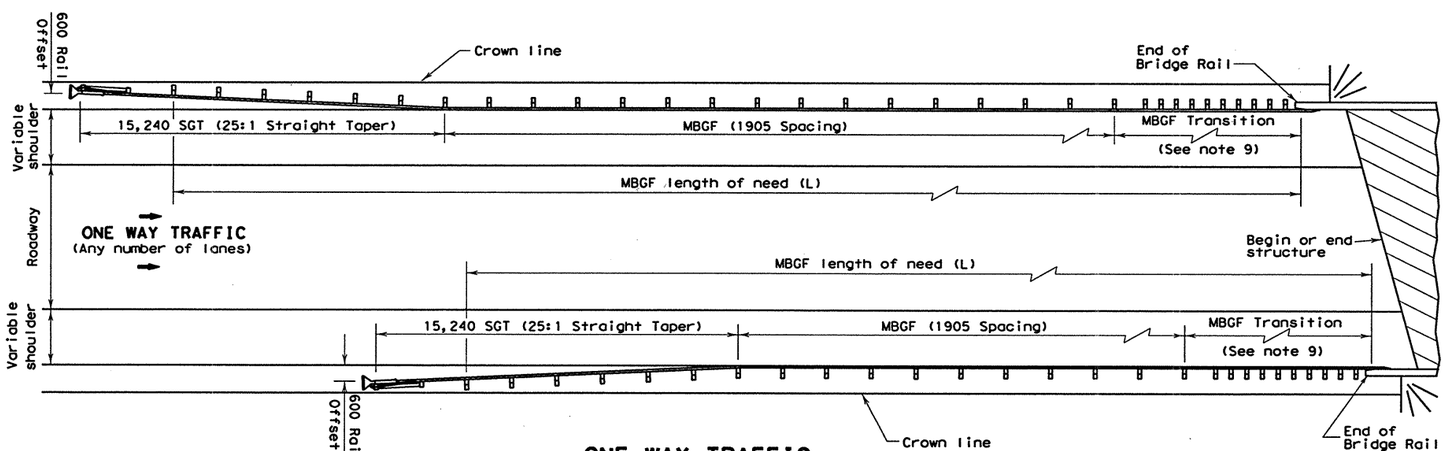
## TWO LANE (RURAL) HIGHWAYS



## MULTILANE UNDIVIDED (RURAL) HIGHWAYS



## ONE WAY TRAFFIC

## GENERAL NOTES

1. For more detail: See MBGF, SGT, and MBGF transition standard sheets.
2. Quantities of metal beam guard fence (MBGF) at individual bridge ends are shown elsewhere in plans.
3. Use average daily traffic (ADT) for the current year to determine MBGF length of need in accordance with the Roadway Design Manual unless otherwise specified. Where significant traffic volume growth is anticipated on low volume (0-750 ADT) highways, use length determinations for the higher volume category.
4. MBGF may not be required to shield departure end of bridge unless other obstacles within the horizontal clearance limits or opposing traffic indicate a MBGF consideration.
5. Terminal anchor sections (T.A.S) are only for downstream end anchorage usage outside the horizontal clearance area of opposing traffic.
6. The crown will be widened to accommodate MBGF. Typically the crown line should be 600 mm from the back of the MBGF post. This applies to new construction on new alignment or where existing roadway cross section is to be widened to increase roadway width. This does not apply to rehabilitation work where existing roadway crown width is to be retained (See Typical Cross Section at MBGF).
7. For restrictive width bridges, a 5715 mm tangent section of MBGF should connect to the wingwall. The adjoining MBGF that lies within the roadway (Lanes & Shoulder area) crown should be flared at the rate of 25:1 (Longitudinal : Lateral). Length at these bridges should be determined as stated above or the length necessary to locate the terminal end at a 600 mm offset from shoulder edge, whichever is greater.
8. Variations in post spacings and/or the use of spacer blocks or shims may be required by the Engineer in order to accommodate the required rail connection to existing structures.
9. Transition length and post spacing will vary depending on transition type. Transition type will be shown elsewhere in the plans.

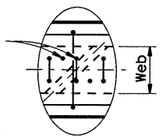
## DETAILS OF SKEWED BEAM ENDS ④

④ Reinforcing patterns shown above are to be used as guides in determining the reinforcement for the actual beam type (Type C shown) and the skew angle used. In general, the distance between consecutive Bars R and/or S shall be 50 mm. This spacing may be varied in order to avoid Dowel Holes or Conc End Diaphragm Option holes (See Detail "A"). However, a minimum cross sectional area equivalent to that of Bars R & S in square beam end shall be provided.

Note: It is permissible for bars or strands to come in contact with materials used in forming anchor and diaphragm holes.

Note: See span details for location of interior diaphragms, if any. For skewed spans, location of diaphragms may vary from beam to beam.

① Note: Anchorage holes may be tapered (120 x 40 mm) at base. If holes are formed with sheet metal, forms may be left in place.



DETAIL "A"

⑧ Bars may be cut or bent at skewed end as required

⑦ Increase for first bar at skewed end

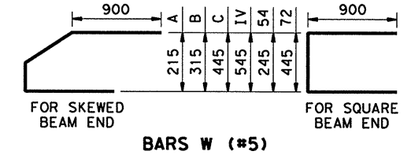
⑥ ELEVATION OF BEAM

Face of Abut Bkwl, Inverted-T Stem or ℄ Interior Bent

⑨ [370 - Cos Skew Angle x 50] at Int Bts
[320] at Abut Bts & Inv-T Bts
Perpendicular to Face of Abut Bkwl or Inv-T Stem.



BARS W (#5)

90° At Int Bents ~ End of beam shall be vertical at Abut Bkwl & Inv-T (1° Tolerance)

GENERAL NOTES:
Designed in accordance with current AASHTO Specifications.
All concrete shall be Class H.
Bottom corners of all beam flanges and outside corners of exterior beam ends shall be chamfered 20 mm or rounded to a 40 mm radius.
Diaphragm holes in ends of beam only for use with concrete end diaphragm option.
The use of diaphragm holes for lifting purposes will not be permitted.
All reinforcing bars for beams shall be Grade 420.
An equal area of welded wire fabric may be substituted for Bars R, V, S or X if approved by the Engineer.
All dimensions are in millimeters unless otherwise shown.

② 75 mm ~ Inv-T Stem

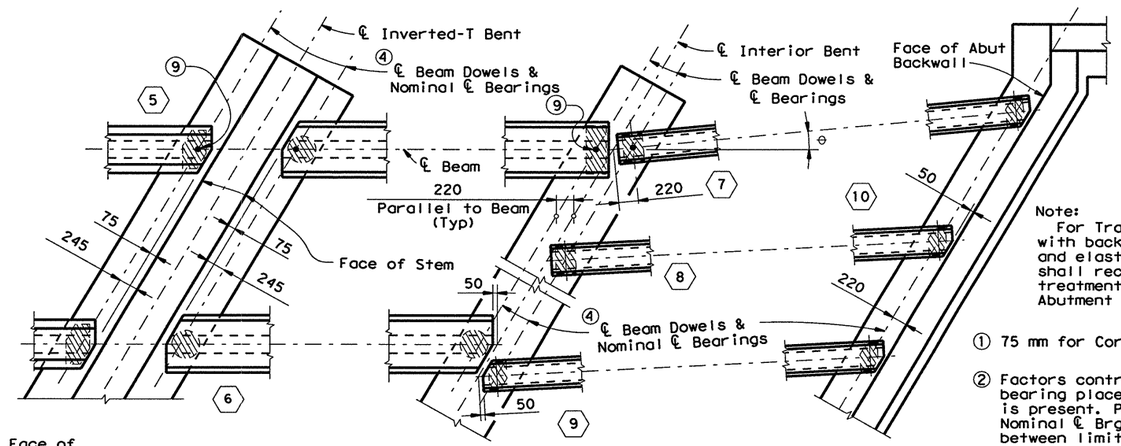
## ELASTOMERIC BEARING PLACEMENT DIAGRAMS



Note: When angle ⊖ exceeds 10°, the beam ends shall be clipped to the bisector of the angle between beams as shown in view ⑮.

## BEAM END DETAILS

Note:
For Transition Bents with backwall, beams and elastomeric bearings shall receive the same treatment as shown for Abutment Bents

① 75 mm for Corbels of Inverted -T.

② Factors controlling laminated bearing placement if no dowel is present. Place ℄ Pad as near Nominal ℄ Brg as possible between limits shown.

③ Provide 50 mm Dia Hole (always on beam end side of centerline pad) only at locations required. See substructure details for location.

④ For purposes of computing Bearing Seat Elevations, nominal centerline of bearing shall be defined as shown. The actual center of bearing pad may vary from this line, according to the "C" value shown in Table. If table shows no "C" value, See ②

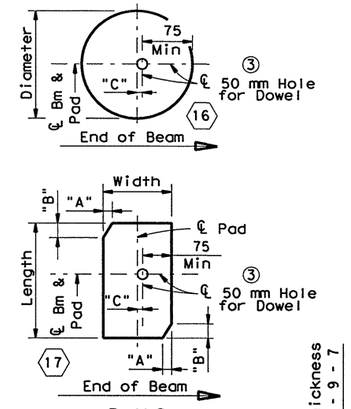
⑤ Interpolate "C" values for angles not shown between 30° & 40°, 40° & 50°, 50° & 60°.

⑥ Complement of Beam Angle except at some conflicting beams. See ⑮

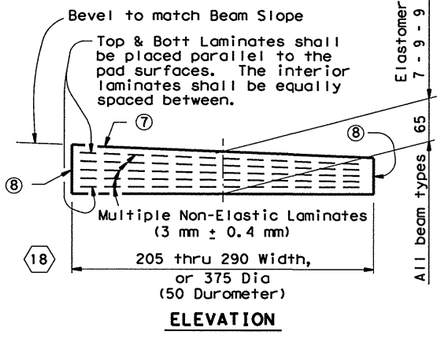
⑦ Locate "BRG TYPE" identification here

⑧ Locate Permanent Mark here

⑨ Provide Beam Dowels for outside beams only when shown (D) on Layout (Beams adjacent to a longitudinal joint at the median are considered as outside beams).



PLANS



ELEVATION

## FABRICATION DETAILS

GENERAL NOTES:
Beams shall be seated on elastomeric bearings of the dimensions shown.
Constant thickness bearings may be used for moderate beam slopes if the variation is within the allowable dimensional tolerances given in the specifications.
Shop drawings will be required for all pads not shown or modified in the table.
Cost of furnishing and installing elastomeric bearings shall be included in unit price bid for "Prestressed Concrete Beams".

Note: The use of Polyisoprene (natural rubber), for the manufacture of bearing pads, shall not be permitted.

### GENERAL NOTES:

Designed according to current AASHTO Standard Specifications for Highway Bridges.

See Bridge Layout of each Structure for Foundation Type to be used.

Details shown on this standard to be used unless shown otherwise in the plans.

Maximum Pile Load for the footings shown shall be as follows : 740 kN/Pile with 600 Dia Column
860 kN/Pile with 750 Dia Column
890 kN/Pile with 900 Dia Column

Standard Footings shall not be used in salt water conditions.

Drilled Shaft reinforcing may be Grade 300.

Oversized Drilled Shafts may be used to accommodate existing equipment.

Piling under wings to be driven to a minimum resistance of 90 kN.

All dimensions are in millimeters unless otherwise shown.

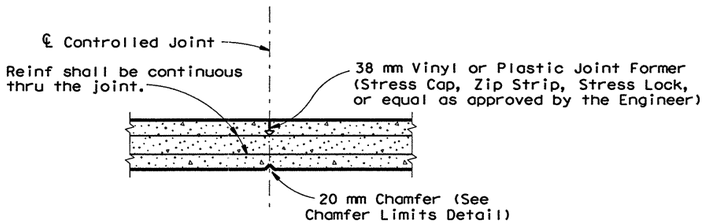
## CHAMFER LIMITS DETAIL

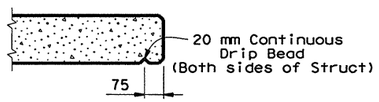
Note: See Span details for type of joint and joint locations.



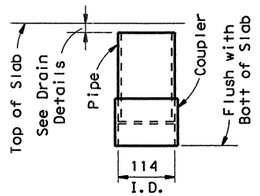
## CONTROLLED JOINT DETAIL

(Controlled Joints shall not be used for simple spans)

Note: For continuous placement, the minimum rate of concrete placing and finishing shall not be less than 9,000 linear mm of bridge deck per hour.

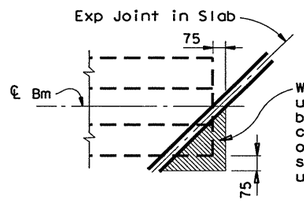


## DRIP BEAD DETAIL



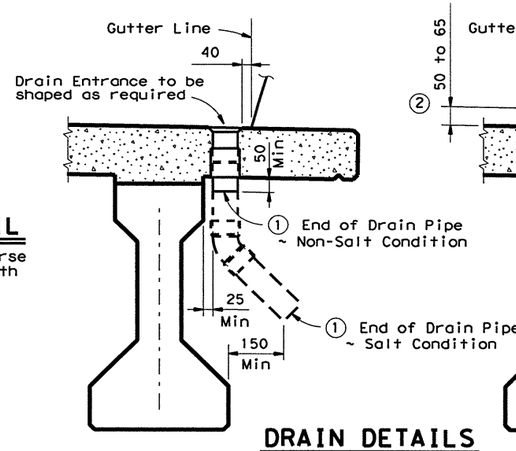
## C.I.P. DRAIN DETAIL

Note: Roughen outside of PVC with coarse rasp or equal to ensure bond with cast-in-place concrete.



Where corners of Beam Flanges project under slab of adjacent span, care shall be taken to provide a minimum of 13 mm clearance between top of beam and bottom of adjacent slab. Polystyrene or other suitable compresssible material may be used as a filler.

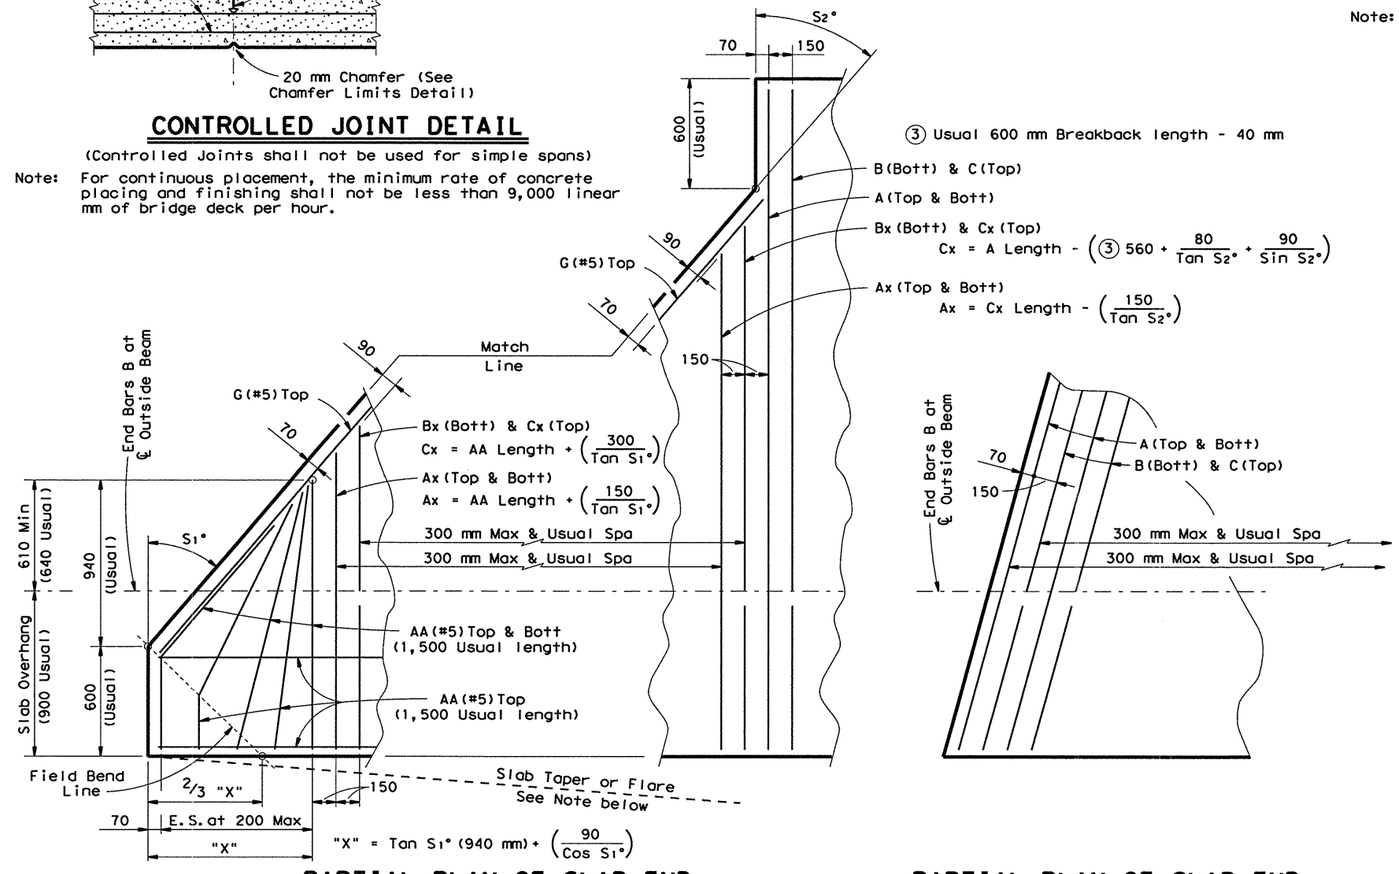
## TREATMENT AT BEAM END FOR SKEWED SPANS



## DRAIN DETAILS

① The longer drain length shown shall be used on structures where the use of deicing salts is anticipated.

Note: All drain pipe and fittings to be 102 mm diameter (Sch 40) PVC. See Item 481 "PVC Pipe for Bridge Drains" for pipe, connections and solent welding. Bend reinforcing steel to clear PVC 25 mm. Drain length and location shall be as directed by the Engineer. No drains shall be permitted over roadways or railways, or within 3,000 mm of Bent Caps. Degrease outside of exposed PVC, apply acrylic water base primer, then coat with same surface finishing material as used for outside girder face. Variations of the above designs, as required for the type of rail used and it's location on the structure, shall be installed with the approval and direction of the Engineer. No water shall be discharged onto girders.



## PARTIAL PLAN OF SLAB END WITH BREAKBACK

(For use with Concrete End Diafram Option ~ See IBDO(M) Standard)

Note: Bar length formulas shown for constant width slabs. Adjustment shall be made for slab taper or flare.

## PARTIAL PLAN OF SLAB END WITHOUT BREAKBACK

(For use with Concrete End Diafram Option ~ See IBDO(M) Standard)

GENERAL NOTES:

Designed in accordance with current AASHTO Specifications.

All cast-in-place concrete shall be Class S unless otherwise shown on span details.

All reinforcing steel shall be Grade 420.

See Span Detail sheet for epoxy coating requirements and lap lengths, if required.

All dimensions are in millimeters unless otherwise shown.

PLAN

ELELVATION

## BOTTOM FLANGE BRACING DETAILS (2)

## GENERAL NOTES:

### ERECTION BRACING:

Erection bracing details are considered minimum for fulfilling the requirements of Specification Item 425 for bracing Types A, B, C, III, IV, and V prestressed concrete beams erected in the span over a traveled way or railroad, and in those spans generally parallel to a traveled way or railroad and within a distance equal to the difference in elevation between the top of cap upon which the beams are being erected and the traveled way, or 9000, whichever is greater.

Required erection bracing shall be placed immediately after erection of each beam and remain in place until diafram bars DN are tightened or additional bracing as required for slab placement is in place. This standard is needed in all cases to meet requirements for Slab Placement Bracing.

### SLAB PLACEMENT BRACING:

The details for slab placement bracing are considered minimum for fulfilling the requirements of Specification Item 420 regardless of where erected.

Required slab placement bracing shall remain in place until slab concrete has attained a flexural strength of 3 MPa.

### GENERAL:

Bracing details for closely spaced beams (as on ramps or railroad structures) are not included herein. The Contractor shall submit his proposed bracing details for such conditions to the Engineer for approval prior to erection.

Systems equal to or better than those shown may be used provided details of such systems are submitted to and approved by the Engineer prior to erection.

Use of these systems and/or details does not relieve the Contractor of the responsibility for the adequacy of the bracing and the safety of the structure.

Removal of bracing for short periods of time to align beams is permissible.

Bottom flange bracing at beam ends may be omitted when all beams are fixed with dowel bars or when erection is on steel caps or floor beams containing bearing seats which restrict lateral movement.

All turn-buckles, come-alongs and other connections shall be capable of developing the full strength of the cable shown hereon.

All dimensions are in millimeters unless otherwise shown.

## GENERAL NOTES:

### HAULING & ERECTION

The Contractor's attention is directed to the possible lateral instability of Type 48 thru 72 prestressed concrete beams, especially during hauling and erection. The use of the following methods of improving the stability of these beams is encouraged and shall be used when required: Location of lifting devices at the maximum practical distance from the beam ends; use of external lateral stiffening devices during hauling and erection; lifting with vertical lines using two machines and care in handling to minimize inertial and impact forces. External adjustable stiffening devices (hog rods) will be required for any beam in excess of the following actual beam lengths.

| | | | |
|---|---|---|---|
| Type 48 | 26,500 | Type 66 | 34,400 |
| Type 54 | 29,200 | Type 72 | 37,200 |
| Type 60 | 31,700 | Type 54 Mod(305Web) | 34,400 |

These devices shall remain on the beam during hauling from the casting yard and during erection until the required bracing is installed.

### ERECTION BRACING:

Erection bracing details are considered minimum for bracing Types 48, 54, 60, 66, 72 and 54 Mod (305Web) prestressed concrete beams regardless of where erected.

Required erection bracing shall be placed immediately after erection of each beam and remain in place until diafram bars DN are tightened or additional bracing as required for slab placement is in place. This standard is needed in cases to meet requirements for Slab Placement Bracing.

### SLAB PLACEMENT BRACING:

The details for slab placement bracing are considered minimum for fulfilling the requirements of Specification Item 420 regardless of where erected.

Required slab placement bracing shall remain in place until slab concrete has attained a flexural strength of 3 MPa.

### GENERAL:

Bracing details for closely spaced beams (as on ramps or railroad structures) are not included herein. The Contractor shall submit his proposed bracing details for such conditions to the Engineer for approval prior to erection.

Systems equal to or better than those shown may be used provided details of such systems are submitted to and approved by the Engineer prior to erection.

Use of these systems and/or details does not relieve the Contractor of the responsibility for the adequacy of the bracing and the saftey of the structure.

Removal of bracing for short periods of time to align beams is permissible.

Bottom flange bracing at beam ends may be omitted when all beams are fixed with dowel bars or when erection is on steel caps or floor beams containing bearing seats which restrict lateral movement.

All turn-buckles, come-alongs and other connections shall be capable of developing the full strength of the cable shown hereon.

## CLEARANCE SIGN MOUNTING BRACKET

(2 REQUIRED PER SIGN)

**GENERAL NOTES:**

Designed according to current AASHTO Standard Specifications.

Protective Angles and Support Brackets shall be Structural Steel conforming to ASTM designation A36M, A572M or A588M and may be shipped in convenient lengths (3,350 mm Min).

Redwood Planks shall be beveled to clear inside radius of Protective Angle and shall be full length of angle. Joints in plank shall not coincide with joints in angle.

Either clearance signs, protective angles or both together may be installed using these details. For clearance signs these details are appropriate for skew angles up to 30°. For protective angles these details are appropriate for any skew.

Plans may require the complete assembly, consisting of protective angle and mounting brackets, sign and sign mounting brackets, or may require only portions of this assembly, all as noted on the structure Layout sheet

All dimensions are in millimeters unless otherwise shown.

For clearance sign details in excess of 30°, include BPA-2(M).

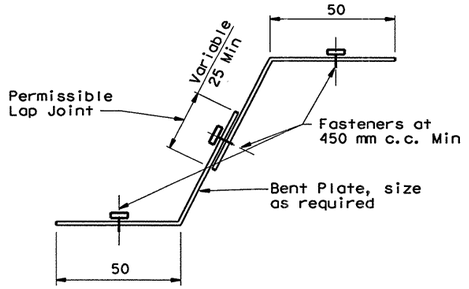
## SECTION THRU BREAKBACK FOR WIDENING



**DETAIL "B"**

APPROXIMATE QUANTITIES FOR ONE SQUARE METER OF SLAB (for Contractors information only)

| Slab Thickness mm | Reinf Steel kg/m² | Class S Concrete m³/m² |
|---|---|---|
| 185 | 32.52 | .2109 |
| 190 | 32.52 | .2146 |
| 195 | 32.52 | .2202 |
| 200 | 32.52 | .2258 |
| 210 | 32.52 | .2345 |

These approximate quantities are for a typical square meter of cast-in-place slab over the average PMDF with corrugations not matching bars. The quantities do not include an allowance for slab overhangs, thickened slab ends, or possible haunch over beams.

**GENERAL NOTES:**

Permenant Metal Deck Forms (PMDF) shall be designed for the dead load of form, reinforcement and concrete plus 244 kilograms per square meter for construction loads. The following allowable stresses shall be used in the design:

| ASTM A653M, Grade | Yield (MPa ) | Allowable Stress (MPa ) |
|---|---|---|
| 230 | 227.5 | 164.8 |
| 255 | 255.1 | 184.8 |
| 275 | 275.8 | 199.9 |
| 340 | 344.7 | 248.2 |
| 550 | 551.6 | 248.2 |
| Weld Metal | | 85.5 |

Maximum deflection under the weight of forms, reinforcement and concrete, or a minimum of 586 kilograms per square meter shall not exceed 1/180 of the form span or 13 mm, whichever is less. The design span for forms shall be clear distance between beam flanges measured parallel to the form flutes minus 50 mm. The minimum thickness of the forms shall be 0.91 mm and that of the support angles shall be 1.90 mm. All forms shall be securely fastened to supports.

All dimensions are in millimeters unless otherwise shown.

This Standard shall be used as a guide in the preparation of shop detail drawings.

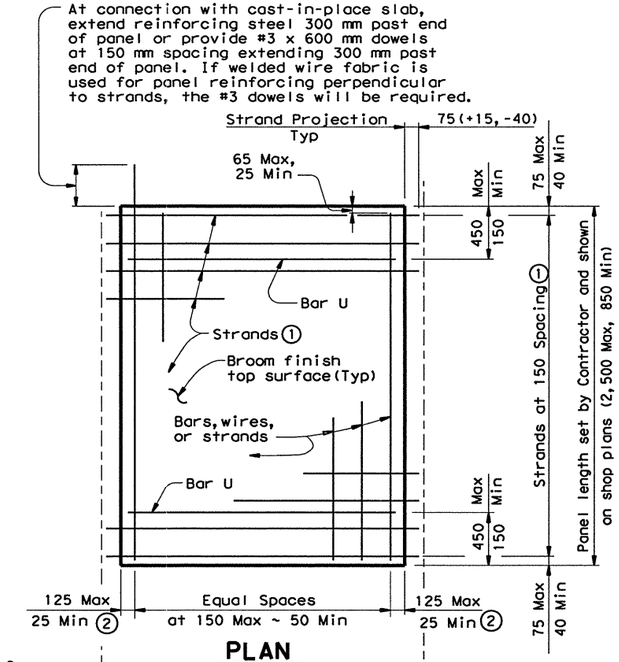
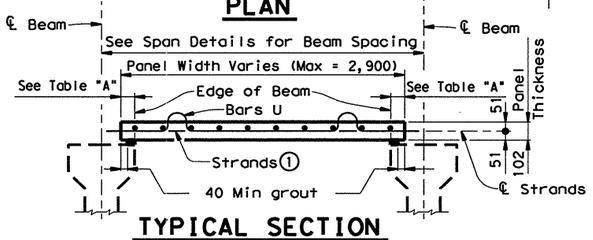
LEVELS DISPLAYED 1 3



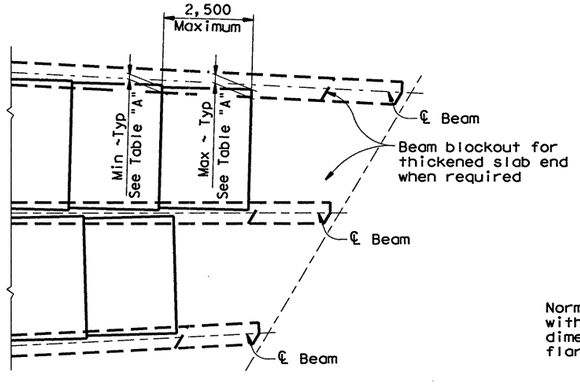
## PLAN



## TYPICAL SECTION

(1) Reinforcing steel #4 (Gr 420) at 150 mm spacing may be substituted for strands in panels 1,500 mm in width or less and shall be required in panels 1,050 mm in width or less. Spacing may be increased to 152 mm to accommodate existing forms. Non - prestressed concrete panels shall have the same dimensional tolerance as prestressed concrete panels in accordance with the Item "Precast Concrete Structures".

(2) May be reduced to 0 mm with welded wire fabric or welded bar mats.

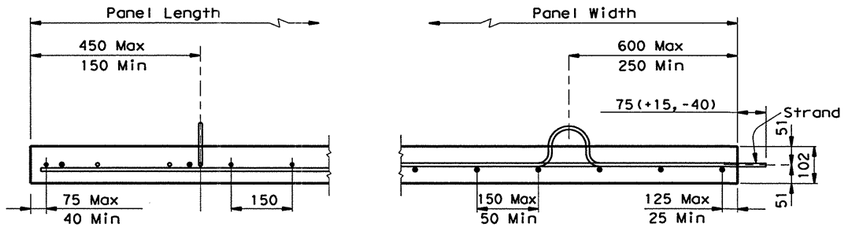


FLARED BEAM SPANS

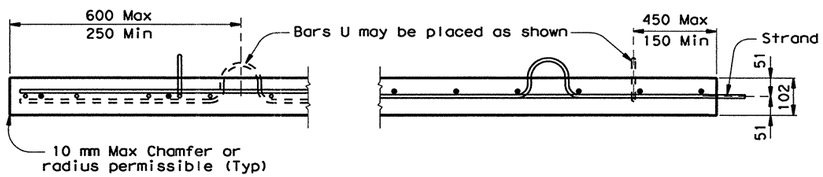
## PART PLAN
(Showing thickened slab end condition)

| TABLE "A" | | | |
|---|---|---|---|
| Beam Type | Normal (mm) | Min (mm) | Max (mm) |
| A | 75 | 65 | 90 |
| B | 75 | 65 | 90 |
| C | 90 | 65 | 100 |
| 54 | 100 | 75 | 125 |
| IV | 140 | 90 | 180 |
| 72 | 140 | 90 | 200 |
| | | | |

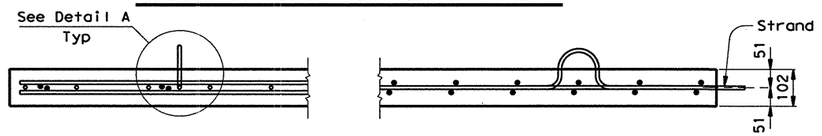
Normal dimensions shall be used on spans with parallel beams. Maximum and Minimum dimensions shall apply only to spans with flared beams.



## REINFORCING BELOW STRANDS

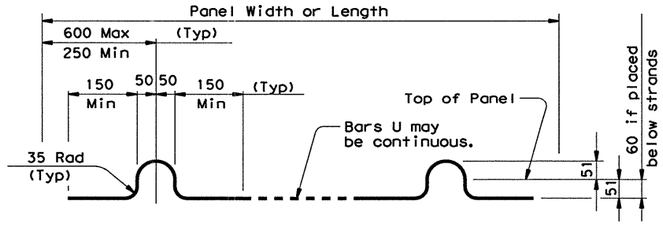


## REINFORCING ABOVE STRANDS

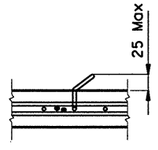


## REINFORCING ABOVE & BELOW STRANDS

Reinforcing steel may be deformed reinforcing bars, welded wire fabric or welded deformed bar mats. Minimum area of reinforcing perpendicular to strands shall be 473 $mm^2/m$. Prestressing strands may also be used, spaced at 150 mm for 13 mm strands and 110 mm for 9 mm strands. Individual bars or wires shall be no larger than #3. Reinforcing parallel to strands shall be as required to ensure proper handling of the fabric or bar mat. A reasonable amount of form oil will be permitted on welded fabric or bar mats.



BARS U (#3)
Note: Four loops required per panel.



For Panels used with Epoxy Coated slab reinforcing, the loops of Bars U shall be field bent as shown. Bars U may be field bent to clear slab reinforcing.

## DETAIL A

GENERAL NOTES:

Designed for MS18 Loading in accordance with AASHTO 1992 Standard and Interim Specifications.

See Span Details for possible restrictions on the use of Prestressed Concrete Panels.

All concrete for panels to be Class H. Release strength f'ci = 28 MPa. Minimum 28 day strength f'c = 35 MPa.

Prestressing strands to be 9 mm - Grade 1860 with an initial tension of 71.62 kN per strand. Larger strands may be used with the same spacing and initial tension.

Suitable holes or anchorage devices for lifting panels may be cast in the panels provided they are shown on the shop plans and approved by the Engineer.

Erected panels shall bear uniformly on bedding strips of fiberboard or extruded polystyrene placed along the outer edge of each beam. A 10 mm gap shall be left at 1,200 mm ± intervals to permit escape of trapped air in the cast-in-place concrete. If additional blocking is needed, special grading details for supporting the panels and extra reinforcing between beam and slab will be required. The cost of this additional blocking will be considered subsidiary to deck construction.

Care must be taken to ensure proper cleaning of construction debris and consolidation of concrete mortar under the edges of the panels. It is also important that the bedding strips be placed at the edges of beams so that adequate space is provided for the mortar to flow a minimum of 40 mm under the panels as the slab concrete is placed. Roadway cross-slope reduces the opening required for proper entry of the mortar. Bedding strips varying in thickness across the beam are therefore required. To allow the proper amount of mortar to flow under the panel, the minimum opening shall be 10 mm.

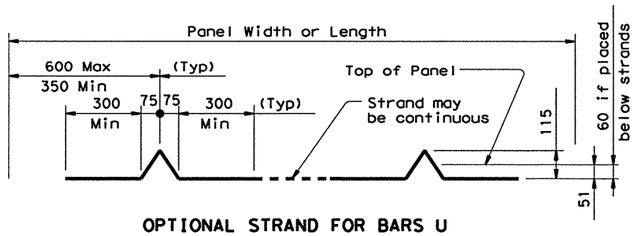
All reinforcing steel in the cast-in-place slab shall be Grade 420. See Table on Sheet 2 of 3 for size and spacing of reinforcement. Orientation of reinforcement (normal or skewed) shall match that shown on the Span Details.

If the top and/or bottom layer of reinforcing steel is shown on the Span Details to be epoxy coated, then the OT, OC, OA, & OM and/or OD, OB, & OE bars shall be epoxy coated.

Bar laps, where required, shall be as follows:
Uncoated ~ #4 = 440 mm
~ #5 = 560 mm
Epoxy Coated ~ #4 = 660 mm
~ #5 = 820 mm

Contractor Note: Details as shown on the PCP Standard sheet are to be used in conjunction with the Span Details and applicable Standard sheets.

All dimensions are in millimeters unless otherwise shown.



OPTIONAL STRAND FOR BARS U
Note: Four loops required per panel.
9 mm or 13 mm strands may be used.

## PART TRANSVERSE SECTION~TYPICAL

(3) The actual thickness constructed may exceed the slab thickness shown on Span Details but, at mid-span of beams the extra thickness shall be no more than 50 mm. Bearing Seat Elevations or finished grade may be adjusted.

(4) Bars OM required when slab clear overhang exceeds the following:
830 at end of unit or other slab discontinuity
1520 at midspan

(5) Clear cover shall be as indicated unless otherwise shown on Span Details. Bars OT may rest on top of prestressed concrete panels if necessary to maintain clear cover.

| TABLE OF REINFORCING STEEL | | |
|---|---|---|
| BAR | SIZE | MAX SPA (mm) |

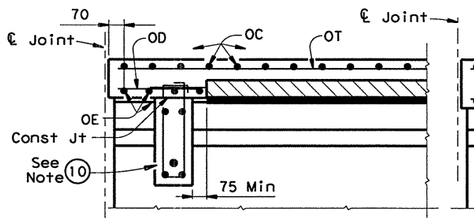
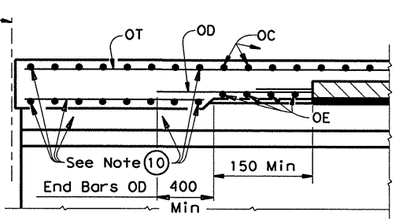
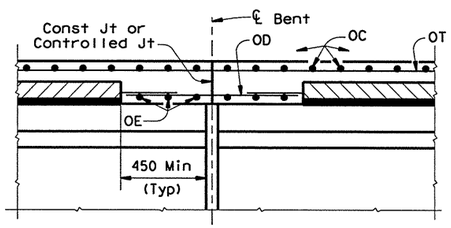
Max Spa as listed unless otherwise shown.



## SECTION AT END DIAPHRAGM

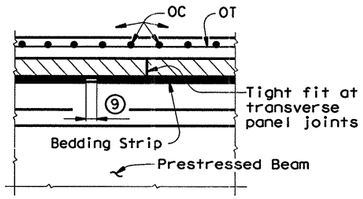


## SECTION AT THICKENED SLAB ENDS



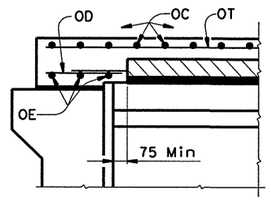
## SECTION AT CONVENTIONAL INTERIOR BENT w/o DIAPHRAGM

(10) For size and spacing of reinforcing steel, see appropriate details elsewhere in plans.

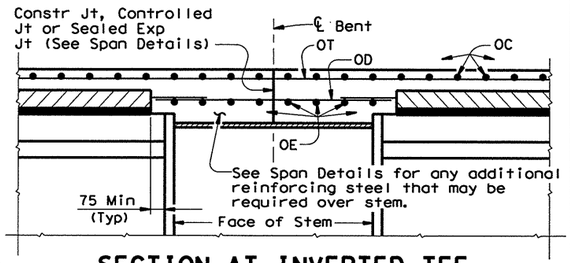


(9) 10 mm Open Joint in bedding strip at 1,200 mm c/c ±. Place 150 mm long piece of bedding strip 10 mm behind opening if necessary to reduce grout leakage.

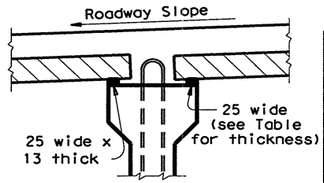
## SECTION AT TRANSVERSE PANEL JOINTS



## SECTION AT ABUTMENT WITH SLAB OVER BACKWALL



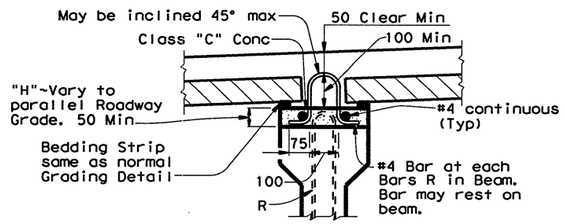
## SECTION AT INVERTED TEE INTERIOR BENT



| BEDDING STRIP THICKNESS (mm) | | | | |
|---|---|---|---|---|
| | MAXIMUM ROADWAY SLOPE | | | |
| BEAM | 80 mm/m | 60 mm/m | 40 mm/m | 20 mm/m |
| A, B, C | 25 | 19 | 19 | 19 |
| S4 | 25 | 25 | 19 | 19 |
| IV, 72 | 32 | 25 | 25 | 19 |

## NORMAL GRADING DETAIL

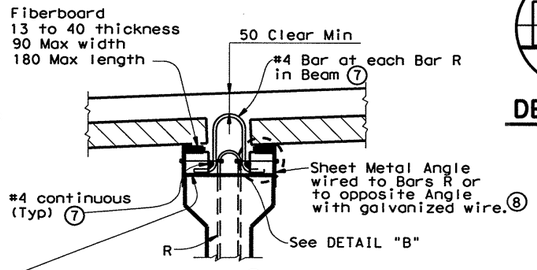
Minimum bedding strip dimensions shall be as shown above. To reduce the quantity of cast-in-place concrete, thickness shown may may be increased by 6 mm increments to a maximum of 40 mm. Strips may be comprised of one layer or two, except that no layer shall be less than 13 mm thick. All layers of bedding strips shall be bonded to the beam and to each other with an approved adhesive. The same thickness strip shall be used under any one panel edge and the maximum change in thickness between adjacent panels shall be 6 mm. Panels may be supported by an alternate method, using a commercial product, if approved by the Engineer of Bridge Design, Design Division.



(6) Concrete blocks used for special grading shall be any convenient plan dimension with a minimum of 50 x 100 mm and a maximum of 100 x 200 mm. Heights may be from 30 mm to 140 mm.

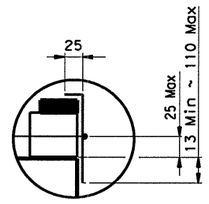
(7) Concrete blocks from 30 mm high to 50 mm high may be used without the additional R bar extensions or longitudinal #4 bars.

(8) For blocks up to 90 mm high, Use 1.61 x 25 x 150 galvanized sheet metal angle and for blocks 90 to 140 mm high, use 1.61 x 25 x 200 galvanized sheet metal angle. Tie sheet metal thru holes in angle at 300 mm centers with 2.0 mm minimum Dia galvanized wire. Sheet metal angles are to be overlapped at splices and left in place. Vent holes 10 mm in diameter are to be placed in angles within the upper 25 mm, spaced at 900 mm centers.

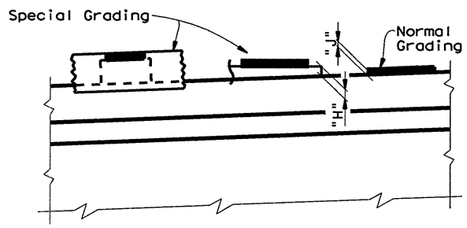


## SPECIAL GRADING DETAILS

For use where the distance between top of beam and finished grade can not be achieved within tolerances on cast-in-place slab thickness and thickness of bedding strips. Panels may be supported by an alternate method, using a commercial product, if approved by the Engineer of Bridge Design, Design Division.

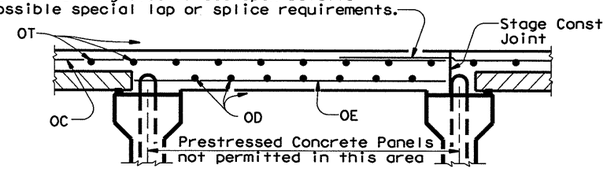


## DETAIL "B"

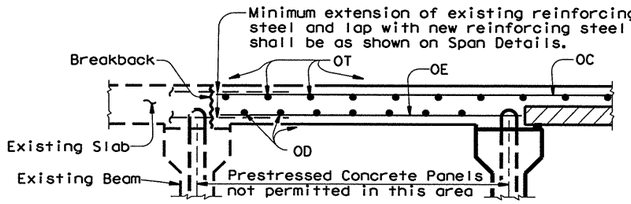


At grading method changes along the beam, the special grading "H" dimension may be reduced to 45 mm and the normal grading "J" dimension may be increased to 50 mm. Some cross-slope conditions may require further H and J adjustments as directed by the Engineer.

560 Min lap (820 Min lap for epoxy coated reinforcing steel). See Span Details for possible special lap or splice requirements.



## STAGE CONSTRUCTION



## BRIDGE WIDENINGS

## PART TRANSVERSE SECTIONS

Examples of potential situations where prestressed concrete panels may not be permitted. Refer to Span Details for limitations on their use.

WATSON BOWMAN & ACME CORP

## SECTIONS THRU SEALED EXPANSION JOINT

NOTES:
Steel sections shall be shipped in convenient lengths of 7,300 mm Max and 3,000 mm Min unless otherwise necessary for stage construction or widenings. One shop splice will be permitted in each shipping length provided no piece is less than 600 mm in length and sufficient studs are added to limit the stud to shop or field splice distance to 50 mm Min and 100 mm Max .
Shop and field splices shall be made by butt welding with areas in contact with preformed joint sealer to be ground smooth.
Corresponding sections shall be match marked and bolted together for shipment.
All steel parts are not to be painted or primed unless designated elsewhere on the plans.

## GENERAL NOTES:

Sealed Exp Jts shall be provided in the size and at locations shown on plans.
Minimum slab thickness required for the use of SEJ-A(M) is 165 mm.
Shop fabrication will be required at all intersections of cross slope and at break points.
Corresponding sections of Sealed Exp Jts shall be temporarily shop assembled, checked for fit, and match marked for shipment.
Erection holes shall be punched so as to line up when Sealed Exp Jts are in their final position.
Stud anchors shall be electric arc end-welded with complete fusion.
The neoprene seal shall be continuous and included in the price bid for Sealed Exp Jt .
The Contractor shall arrange for securing the Sealed Exp Jt in position, and placing to the proper grade and alignment by welding braces to adjacent reinf steel, to prestressed beam stirrups, or to anchors cast in concrete diaframs. Cost of temporary bracing is to be included in the price bid for Sealed Exp Jt .
After bracing and welding the steel section, the erection bolts and spacers shall be removed and erection holes sealed before placing slab concrete.
All dimensions are in millimeters unless otherwise shown.

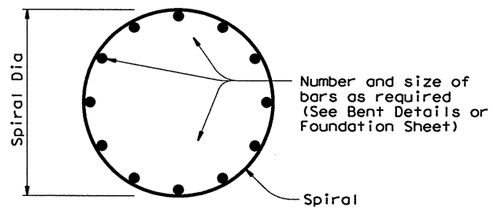
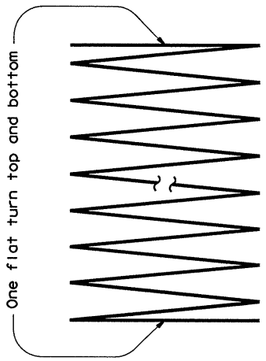
## BAND DETAILS





Spiral to be at the pitch and diameter as shown elsewhere in the plans.

## SPIRAL DETAIL

### GENERAL NOTES:

At the Contractor's option, any or all drilled shafts may be constructed using these details in lieu of the drilled shaft details shown elsewhere in the plans.

These details shall not be applied to single column bents supported by a single shaft, or to overhead sign bridge towers supported by a single shaft, or to high mast illumination pole foundations. Unless otherwise noted, all drilled shafts on stream crossings and any others specifically noted in the plans shall have full reinforcement and be excluded from applications of these details.

All welded bands and reinforcing steel, including that projecting the required amount from the top of the shaft, shall not be paid for directly, but shall be subsidiary to the bid item, "Drilled Shaft Foundations"

Tack welding of spiral to main steel will not be allowed in the upper 4,500 mm of drilled shaft.

All dimensions are in millimeters unless otherwise shown.

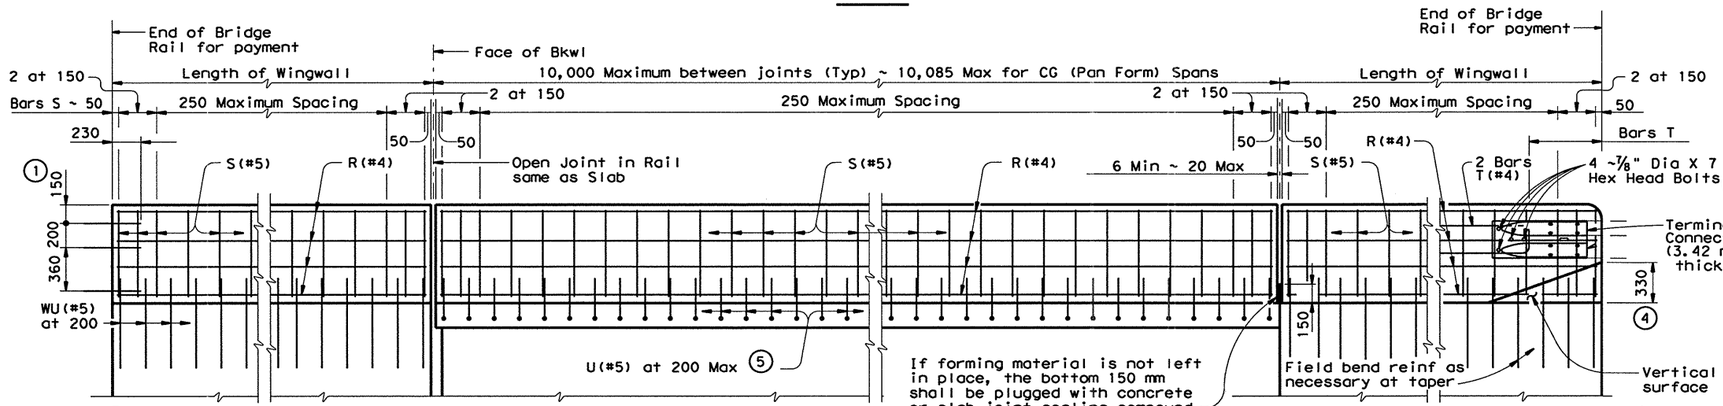
**ABUTMENT WINGWALL PANEL**
(Showing dowels for connection to approach Concrete Traffic Barrier)

**TYPICAL PANEL**

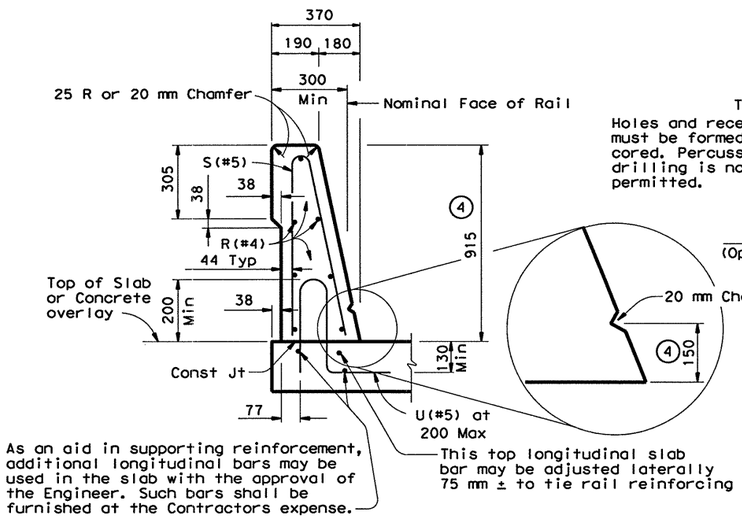
**ABUTMENT WINGWALL PANEL**
(Showing MBGF Attachment)

## PLAN

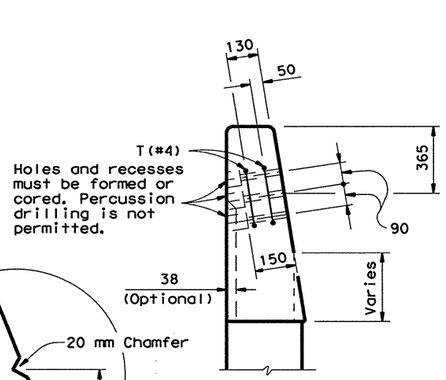


(1) Connection to be same as for approach CTB if dowels are not used.
(2) 1 ¾" Dia washer required under ⅞" Dia Bolt Heads and Nuts.
(4) Increase 50 mm for Structure with overlay
(5) For ACP Overlay exceeding 75 mm, reduced bar spacing may be required.

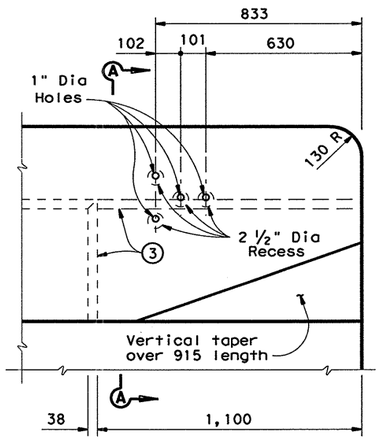
## ROADWAY ELEVATION OF RAIL



## TYPICAL SECTION
(SHOWING CONVENTIONAL REINF)



## SECTION A-A



(3) Back offset may optionally be continued to end of railing.

## END TREATMENT AT MBGF

GENERAL NOTES:

Designed according to current AASHTO Standard Specifications for Highway Bridges. Structurally evaluated to be equivalent or greater in strength to other safety-shape railings which have been crash tested to NCHRP Report 230 SL-2 criteria. Also equivalent to railings tested to 1989 AASHTO Guide Specification PL-2 criteria and Texas Transportation Institute research project No. 9429 CDK.

All parts of the railing including concrete parapet wall, reinforcing, terminal connector, bolts, nuts and washers are included in the price bid per linear meter of rail.

All steel components except reinforcing shall be galvanized unless otherwise shown in plans.

All concrete for railing wall shall be Class "C".

All reinforcing steel shall be grade 420.

Metal Beam Guard Fence or Concrete Traffic Barrier is usually attached to the abutment wingwall panel. See plan sheet for details and length for payment. The splice between the approach guard fence and the terminal connector shall be with the normal eight bolts. The dowel connection to the approach traffic barrier shall be grouted the same as other barrier joints.

Shop drawings will not be required for this rail.
