## **INTRODUCTION**

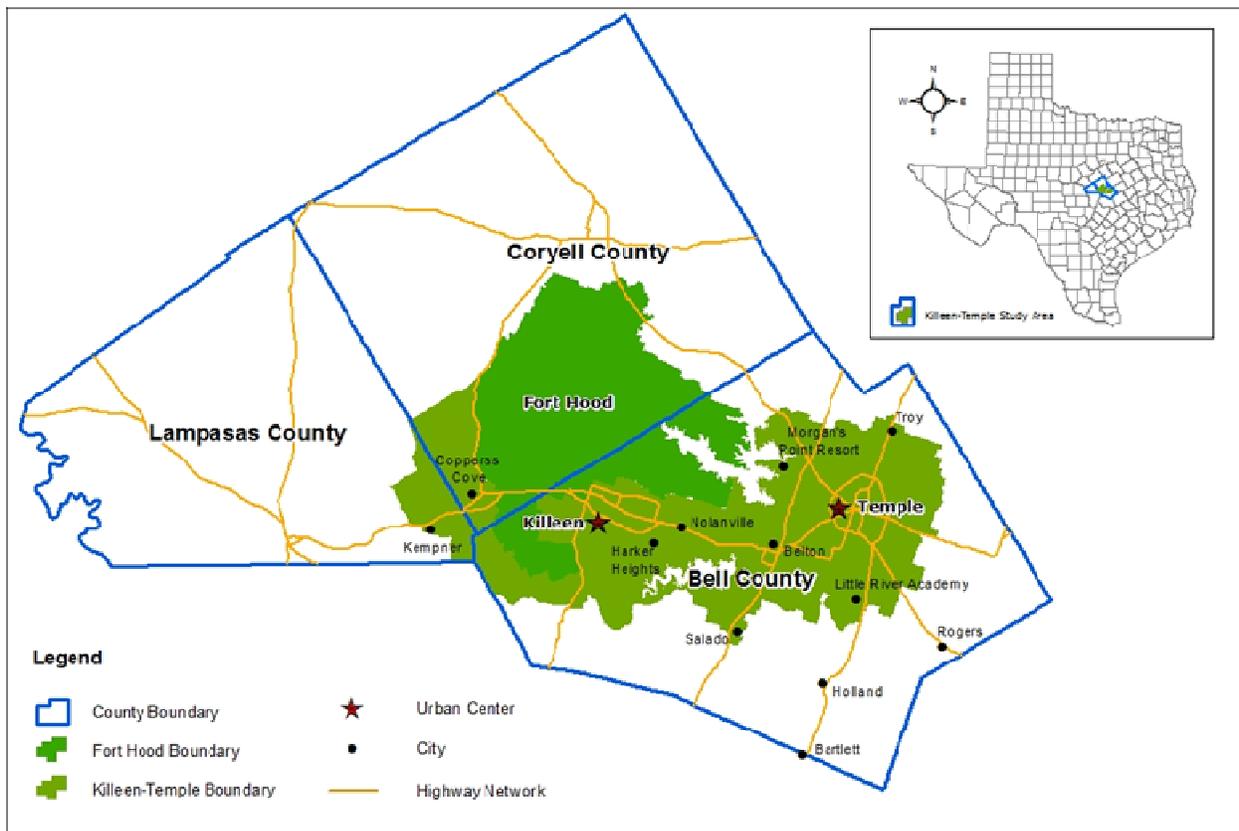

From 2007 to 2010, the Transportation Planning and Programming Division (TPP) of the Texas Department of Transportation (TxDOT) sponsored a comprehensive set of travel surveys in the Killeen-Temple Metropolitan Planning Organization (MPO) area located in Bell County, parts of Lampasas and Coryell counties, and portions of Fort Hood in central Texas. Throughout this report, the area will be referred to as the Killeen-Temple Urban Transportation Study (KTUTS) area. The purpose of the surveys was to collect data and information needed as input to the KTUTS area travel demand model for this three-county area. The model is an important planning tool used to forecast future traffic levels on area roadways, evaluate the region's transportation plan, and aid (if needed) in the region's air quality conformity analyses. Most urbanized areas in Texas (as well as in the U.S. and abroad) rely on travel forecasting models as a tool in their transportation planning and air quality analysis efforts. Since modeling results may be used in determining conformity or non-conformity status of transportation plans to federal clean air regulations, the use of accurate and up-to-date data from regional travel surveys is important to TxDOT and MPOs across the state.

Three different types of origin-destination travel surveys were conducted in the KTUTS area, including a household survey, a work place survey, and a commercial vehicle survey. The household survey collected data on the amount and characteristics of travel generated by households within the area. The work place survey collected data on travel to and from area businesses, special generators, and places of employment. The commercial vehicle survey collected data on cargo transport vehicles and fleet or service vehicles of area governments and businesses. Each survey collected a different component of travel needed for the travel demand model. All surveys were designed to capture characteristics of weekday travel during the school year.

This report summarizes the results of the household survey for the KTUTS area. A variety of household summary information is presented in this report. The summary information is subject to modification as the survey data are further evaluated and analyzed within the context of all the travel surveys conducted.

The household survey sample design is based on obtaining travel information from a pre-determined number of households within certain ranges of household income and household size. The desired number of surveyed households in any household size/income range is not proportional to the estimated number of households in the cell. Rather, the number of households to be surveyed in each cell was based on the total estimated number of households in the area and the expected number of trips the households will make during a typical school-year weekday.

The survey design is based on a desired level of accuracy of +/- 10 percent with a confidence level of 90 percent of the total person trips in the survey area. Figure 1 shows the survey area. The number of households in the study area in 2007 was estimated from the 2000 census and the Texas State Data Center (TSDC) population projections. Table 1 shows the estimated number of households in the study area, the number of households surveyed, and the distribution of the number of households surveyed stratified by household size and household income range.

**Figure 1. Killeen-Temple MPO Study Area.**

A total of 1,444 households were surveyed. The minimum number of households surveyed in any household size/income range cell was 13 and the maximum number surveyed was 142. The higher number of households surveyed in household sizes one and two is desirable due to the high number of households with one or two persons. Of the estimated 125,934 households in the study area, 24.1 percent are households with one person and 29.9 percent are households with two persons.

## **HOUSEHOLD SURVEY RESULTS**

This survey represents a sample of household demographic and travel characteristics for a Monday through Friday weekday during the school year in the fall of 2007 and the spring of 2008. The survey data were collected from travel diaries completed on a specified travel day for all occupants of 1,444 households located in the KTUTS planning area (Figure 1).

### **Key Points Regarding Household Survey Data**

- The survey data is for an average weekday in the fall of 2007 and the spring of 2008.
- The survey data were tabulated only for persons who lived in the surveyed households. Persons living in group quarters, such as nursing homes, correctional facilities, or dormitories were not surveyed.
- The survey data are for persons of all ages unless otherwise noted.
- The survey data do not include non-household-based travel such as commercial vehicles or tourists or persons staying in hotels.
- The estimates for population and number of households are based on the expanded survey data and may differ from population and household estimates developed by other agencies.
- The survey data is for trips that began and ended within the planning area. Trips that began inside the planning area and ended outside the planning area, or vice versa, are summarized in the external station survey report.

### **Findings of the Survey**

For the KTUTS planning area:

- 97.1 percent of the households had a vehicle available.
- 98.9 percent of the households had a licensed driver.
- In general, trip rates per household increased with household size, with household income, and with vehicle availability.
- The average vehicle occupancy was 1.42 persons per vehicle.
- Over 92.3 percent of all person trips were made in a personal-use vehicle.

- Of the household population that traveled, 68.9 percent drove a vehicle, 23.4 percent rode as a passenger in a vehicle, 2.9 percent walked, and less than 0.1 percent used public transportation.
- Just over 25 percent of the total persons within the household population did not made an internal trip within the planning area on their survey day.
- On average, each person made 3.6 person trips per day and each household made 9.6 person trips per day.
- The average person trip length was 5.1 miles and the average person trip duration was 10.1 minutes.
- The average vehicle trip length was 5.4 miles and the average vehicle trip duration was 10.3 minutes.
- The peak hour for household travel was from 7:01 a.m. to 8:00 a.m., during which 12.8 percent of the trip starts occurred. The second highest hour for household trip starts was from 3:01 p.m. to 4:00 p.m. when 9.0 percent of the daily trip starts occurred.
- Weekday school year household travel internal to the study area accounted for an estimated 4.29 million vehicle miles of travel (VMT).

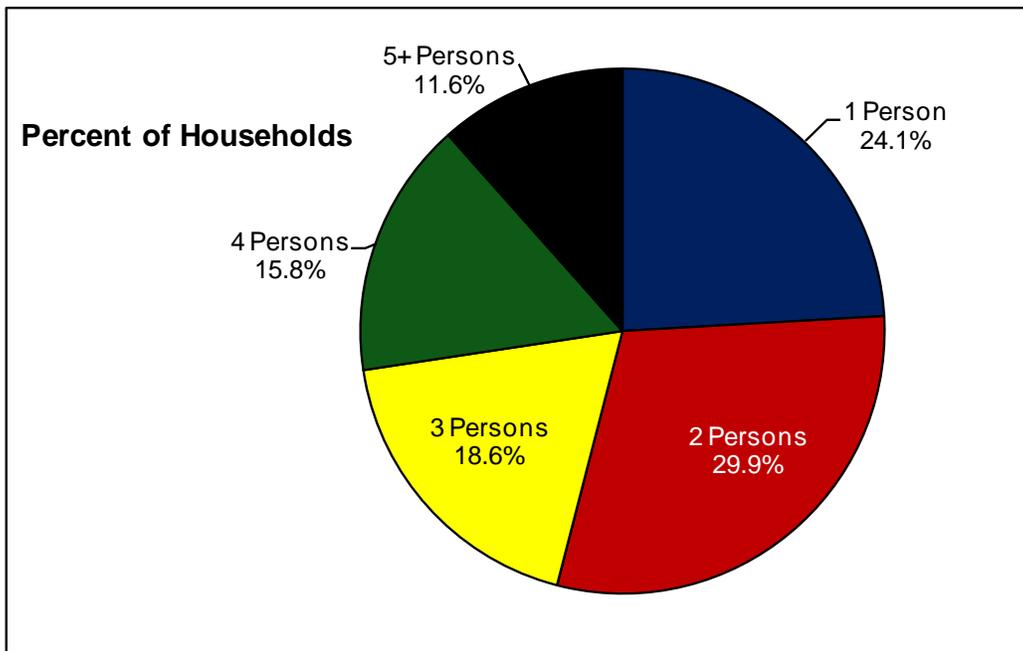

## **HOUSEHOLD CHARACTERISTICS**

Characteristics of the household influence travel behavior. For example household size, income, vehicles available, number of persons employed, and family life cycle affect the amount and the time-of-day that trips are made. For this survey, households include only persons living in residences, and do not include persons living in group quarters. The figures in this section are for the expanded survey data.

### **Household Size**

Figure 2 shows the distribution of households by household size for 2007-2008. Household size and household income range are the two household variables used to stratify the household trip rates calculated from the household travel survey. When forecasting future travel, the forecast population must be estimated by household size and household income range. Average

household size in the KTUTS planning area in 2007-2008 estimated from the survey was 2.67 persons per household. For the KTUTS planning area travel model, three variables—household size, household income, and the number of persons employed in the household—were used to stratify trip rates for the home-based work (HBW) trip purpose. For the home-based non-work (HBNW) and the non-home based (NHB) trip purposes, two variables—household size and household income—were used to stratify trip rates.

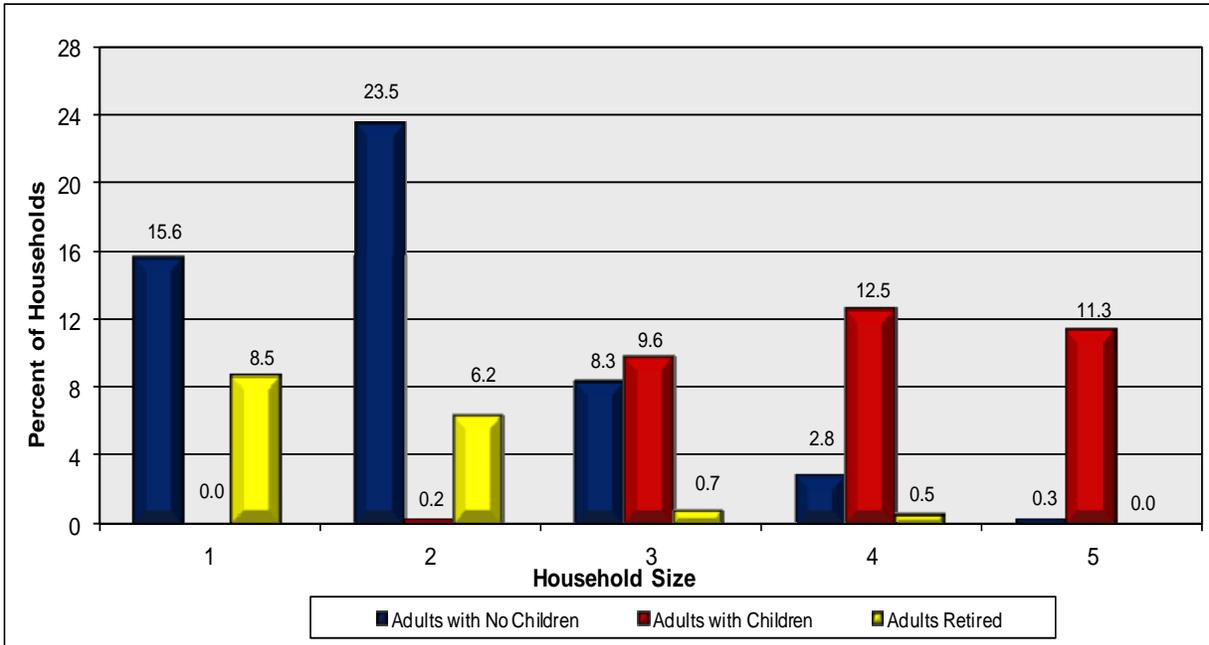

**Figure 2. Distribution of Households by Household Size.**

A typical household makes a certain number of trips on most days to meet household needs, for example, to purchase food and other necessities, to earn an income, to attend school, to visit friends and family, to receive medical care, to attend events, etc. For this reason, the number of households is a better predictor of future travel than using the number of persons.

### **Household Life Cycle**

Household life cycle influences the amount and time of travel. For example, households with children tend to make more trips than households without children. Households with working adults tend to make more trips than households with retired adults. There were an estimated 125,934 households in the KTUTS planning area in 2007. Figure 3 shows the distribution of

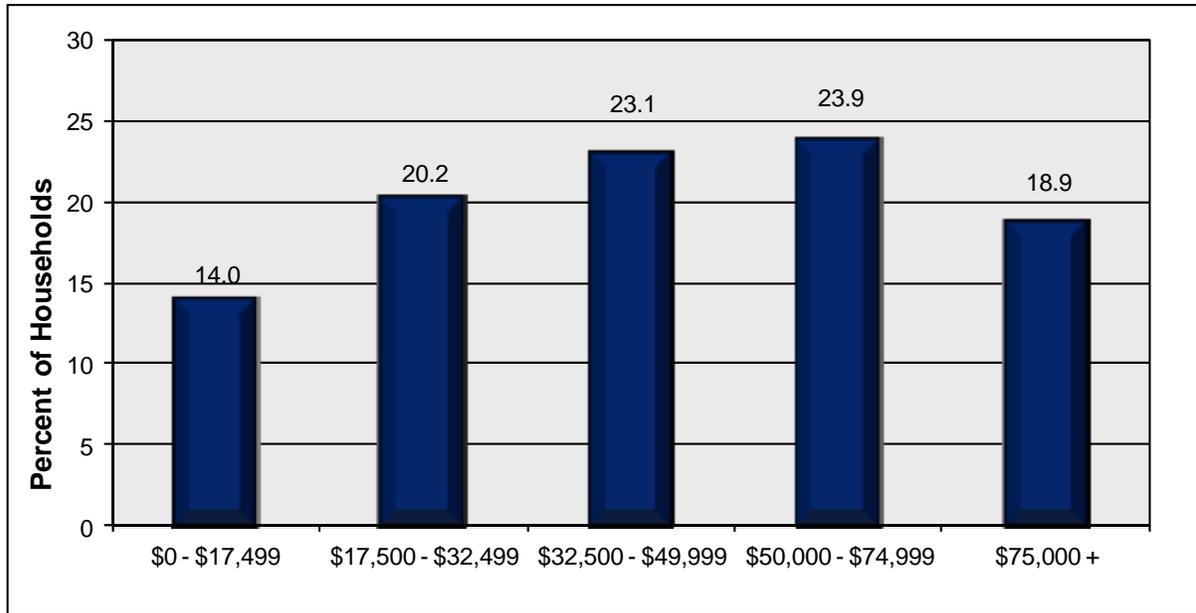

these 125,934 households by those with no children and not retired, those with children, and those with only retired persons.

**Figure 3. Distribution of Household by Life Cycle.**

### Household Income

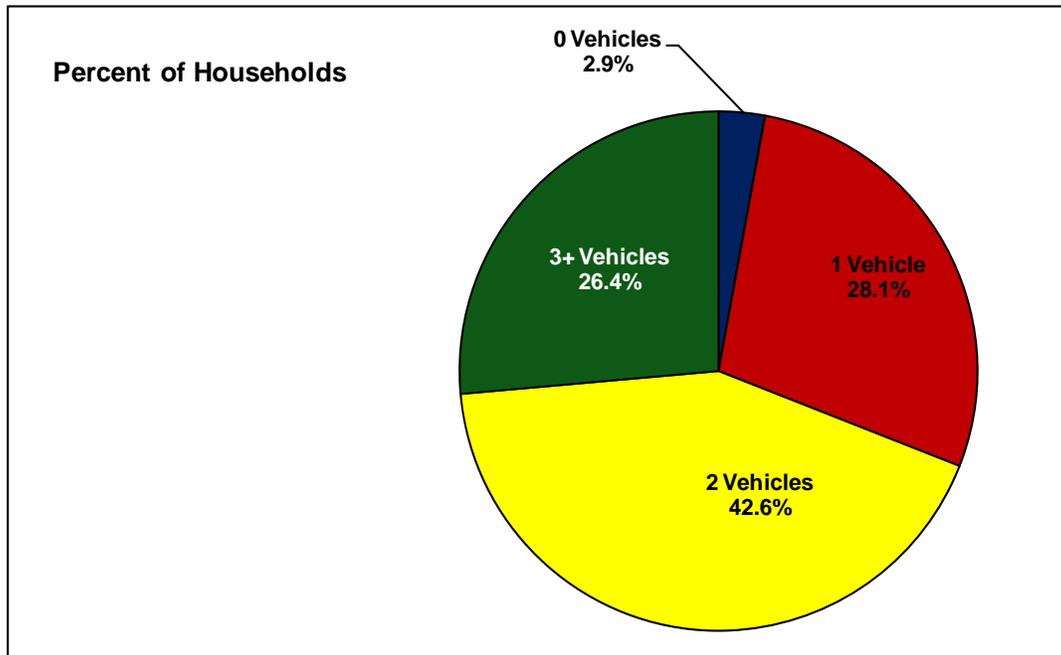

Household income and household size are the two primary variables used to estimate household trip rates. As household income increases, the amount of household travel tends to increase. Additionally, as income increases, vehicle ownership tends to increase and additional financial resources are available to the household to support increased travel. Figure 4 provides the distribution of the 125,934 expanded households in the survey by the combined annual household income range.

**Figure 4. Distribution of Household by Household Income Range.**

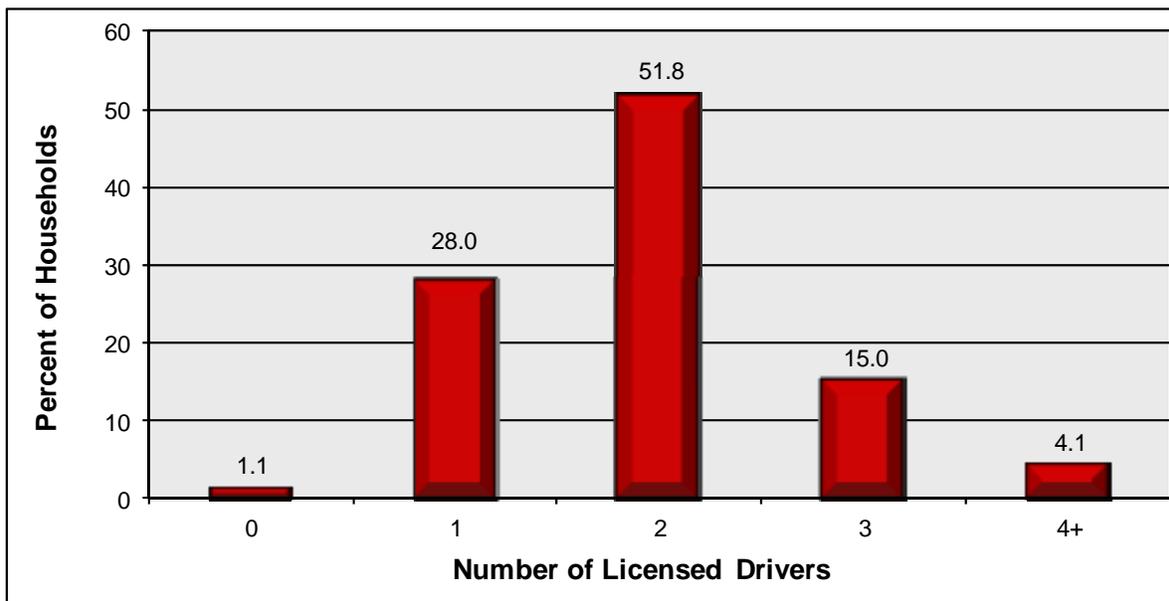

**Household Vehicle Availability and Licensed Drivers**

In general, as the number of vehicles available to the household increases, daily household travel increases. This household characteristic also impacts forecasting the demand for public transportation. As household vehicle availability increases, the household demand for public transportation tends to decrease. Figure 5 shows the distribution of the 125,934 expanded households in the survey by the number of vehicles available. Slightly less than 3 percent of households did not have a vehicle available. The average number of vehicles available per household was 2.0.

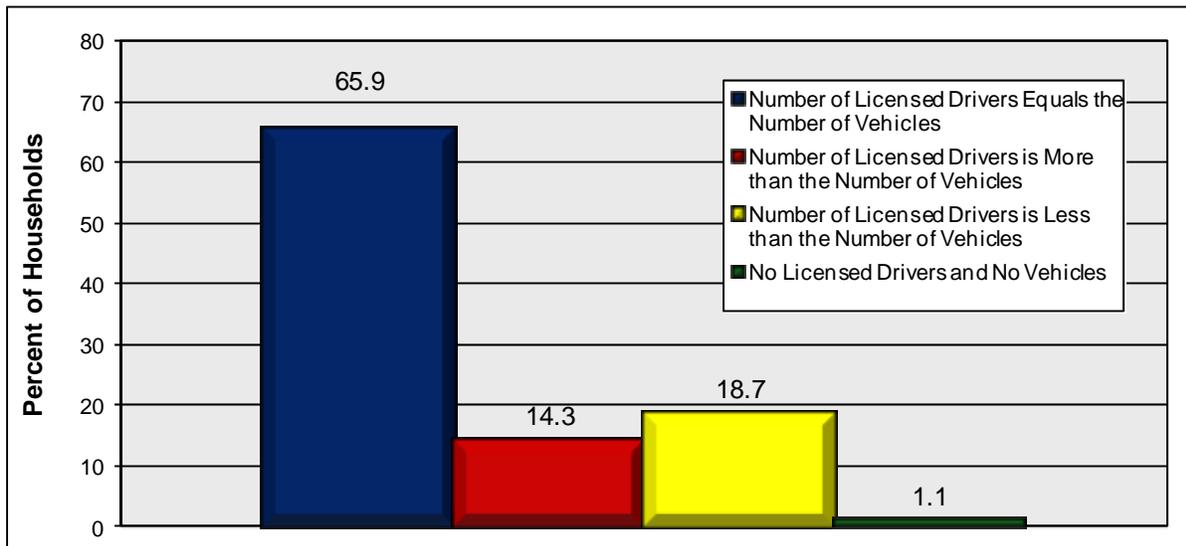

**Figure 5. Distribution of Households by Number of Vehicles Available.**

Figure 6 shows the distribution of the 125,934 expanded households by the number of licensed drivers per household. Just over 1 percent of the households did not have a licensed driver.

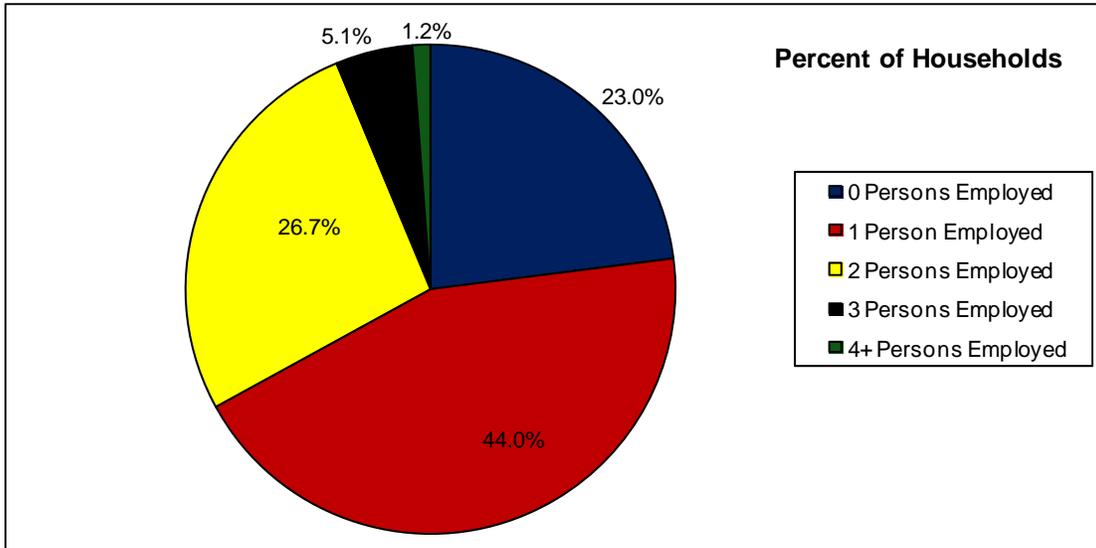

**Figure 6. Distribution of Households by Number of Licensed Drivers.**

Figure 7 shows the distribution of the 125,934 expanded households by the number of licensed drivers and the number of vehicles available. For the majority of households (66 percent), the number of licensed drivers and the number of vehicles available was equal. For 19 percent of the households, the number of licensed drivers was less than the number of vehicles available, and for 14 percent of the households, the number of licensed drivers was greater than the number of vehicles available. Just over 1 percent of the households had neither a licensed driver nor a vehicle available.

**Figure 7. Distribution of Households by Licensed Drivers and Vehicle Availability Household Employment**

The 125,934 expanded households included 335,963 persons for an average of 2.7 persons per household. Figure 8 shows the distribution of the 125,934 expanded households by the number of persons employed.

**Figure 8. Distribution of Household by Number of Persons Employed.**

Figure 9 shows the distribution of all persons regardless of age by employment status. More than 32 percent of the population was employed full time and 23 percent of the population were students. Over 16 percent of the population is retired.

**Figure 9. Distribution of Persons by Employment Status.**

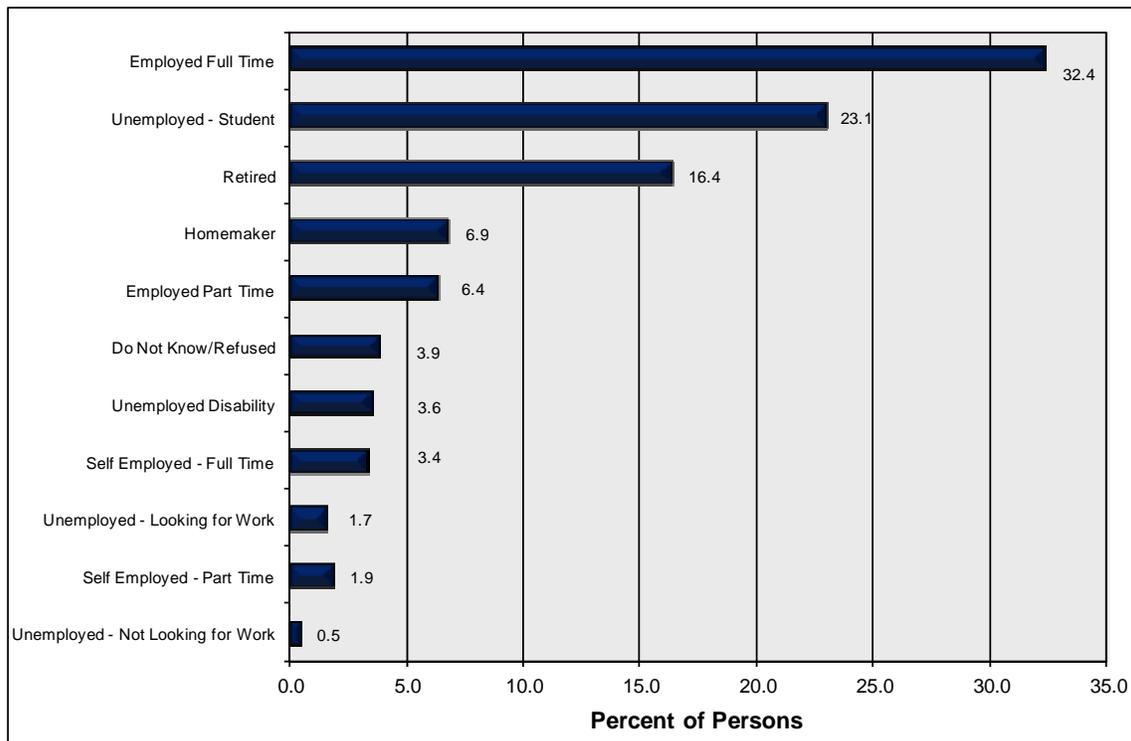

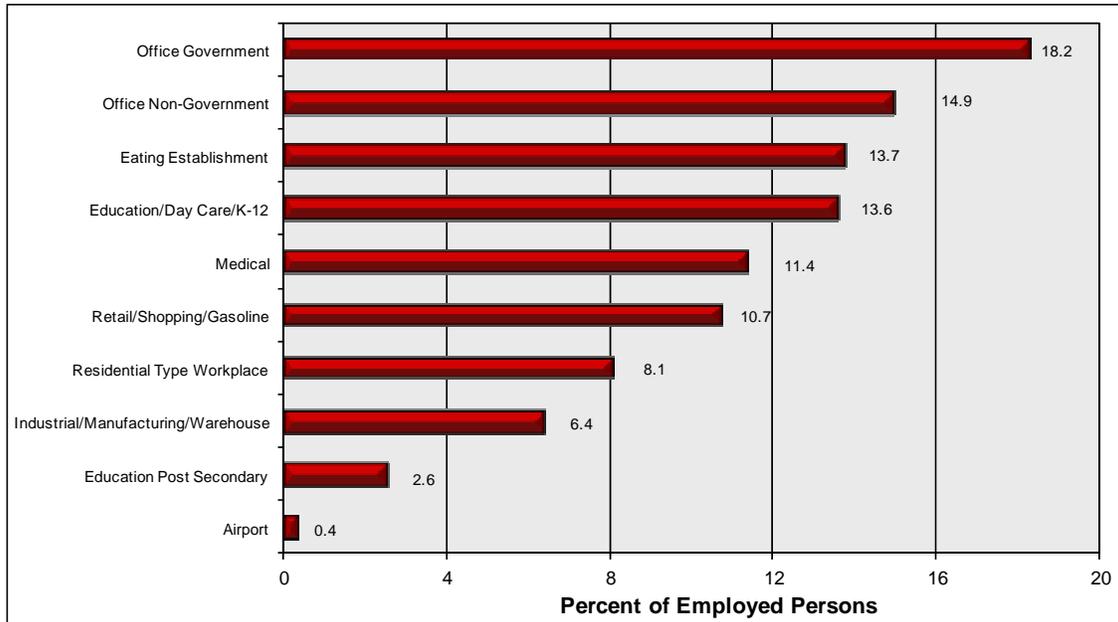

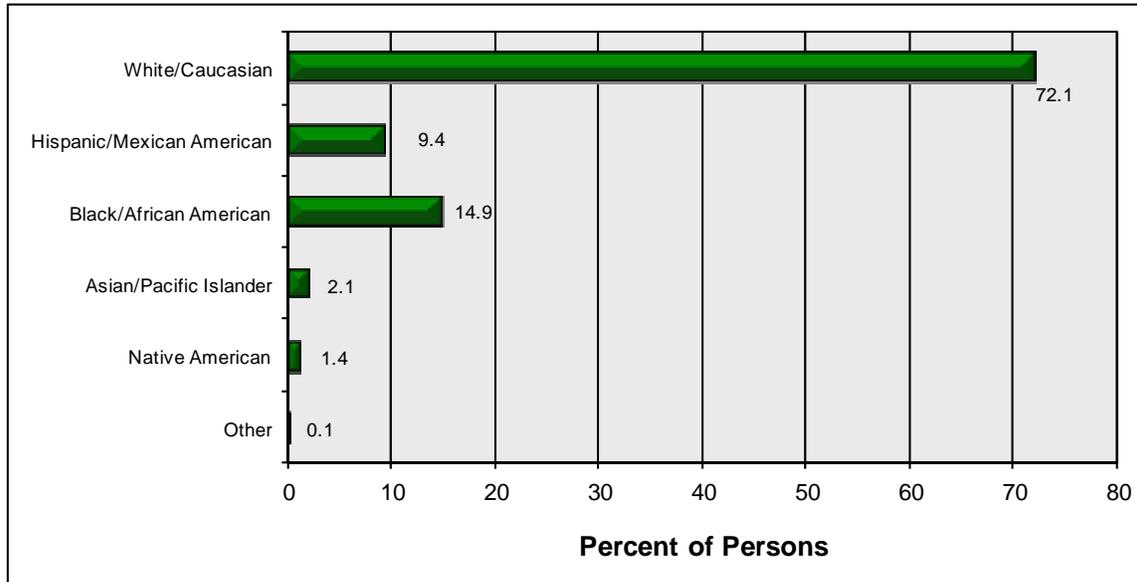

Figure 10 shows the distribution of the employed persons by the type of employer. The 125,934 households had 148,172 employed persons for an average of 1.18 employed persons per household. The employer type “office (government)” included the largest percentage of employed persons, having more than 18 percent of those employed. The “office (non-government)” employer type accounted for the second largest percentage of employed persons, having nearly 15 percent.

**Figure 10. Distribution of Employed Persons by Employer Type.**

### **Ethnicity**

Figure 11 shows the distribution of the 335,963 persons by ethnicity. Over 72 percent of the population was White/Caucasian, nearly 15 percent of the population was Black/African American, and over 9 percent of the population was Hispanic/Mexican American. All other ethnicities combined comprise less than 4 percent of the population.

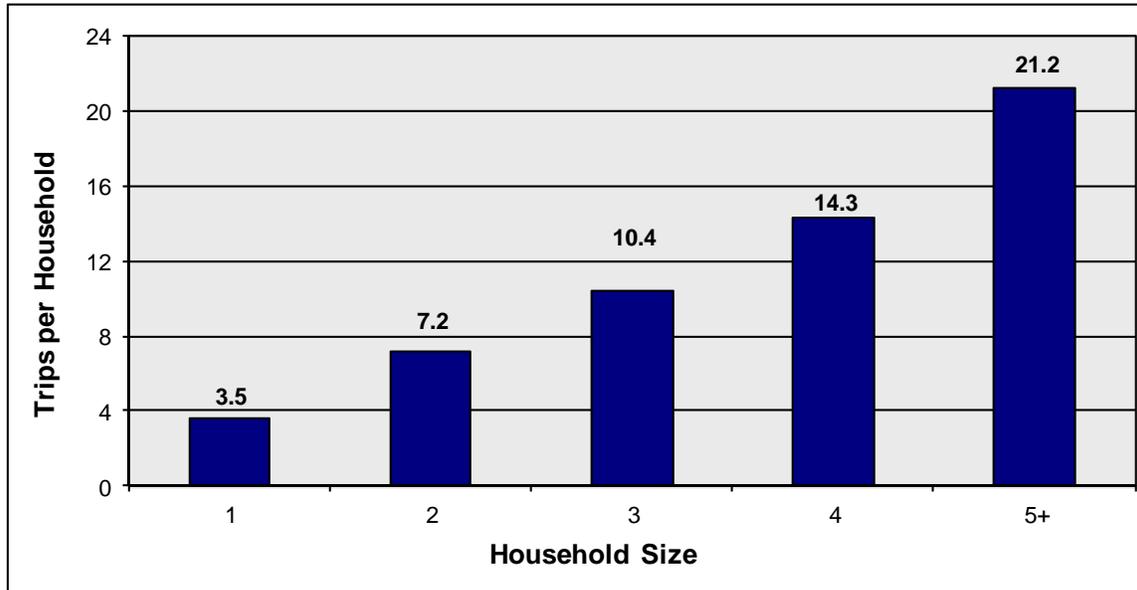

**Figure 11. Distribution of Persons by Ethnicity.**

### **Traveler Characteristics**

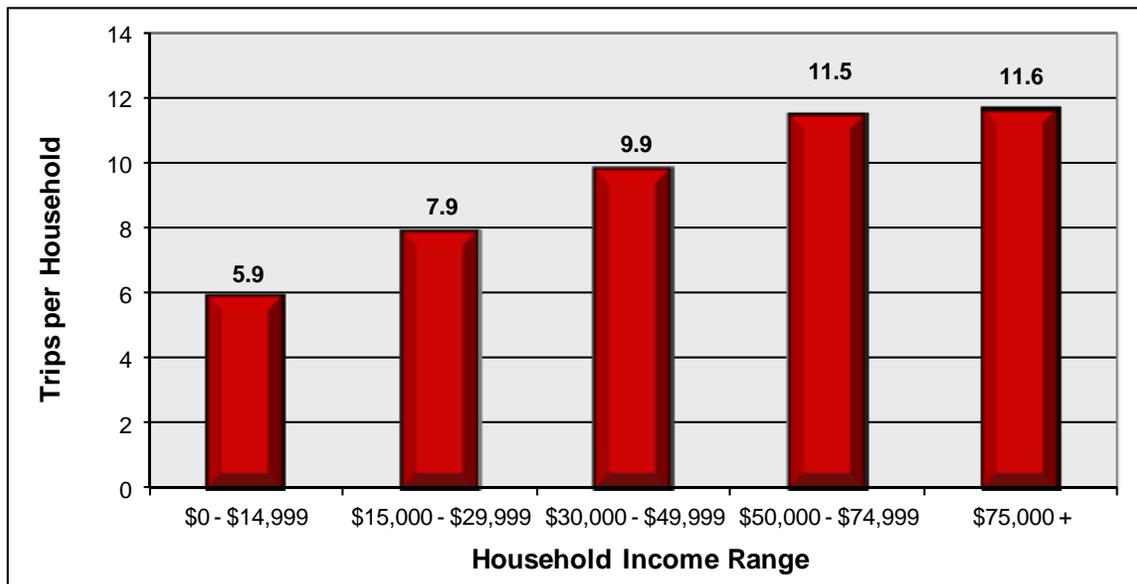

The previous section reported on a variety of household and person characteristics obtained from the household travel survey. In this section, these household and person characteristics are related to household travel characteristics. Household size, household income, household life cycle, household vehicle availability, household licensed drivers, and household employment all affect the amount of household travel.

### **Household Trip Rates and Vehicle Occupancy**

The household trip rates in this section are for person trips made in a vehicle either as the driver or as a passenger. Figure 12 shows the household trip rates as a function of household size. As the household size increases, household trip rates increase and become higher for large household sizes. For travel forecasting applications, households with five or more household members are grouped and an average trip rate is used for the group. Figure 13 provides the household trip rates as a function of the household income range. As expected, as household income increases, the household trip rate increases.

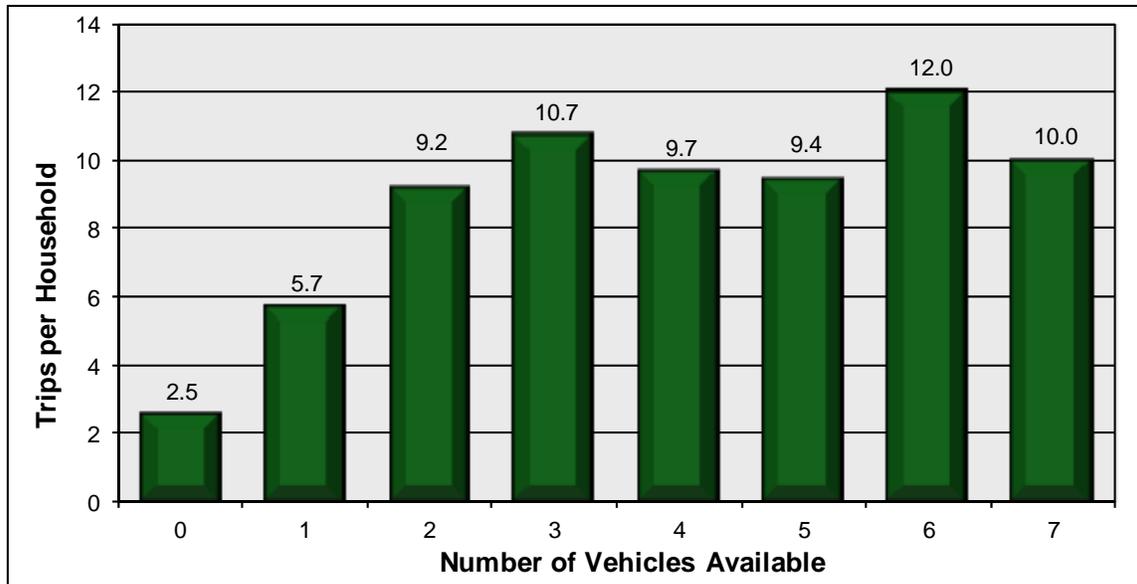

**Figure 12. Household Trip Rate by Household Size.**

**Figure 13. Household Trip Rates by Household Income Range.**

Figure 14 shows the household trip rates as a function of the number of vehicles available to household members for travel. As expected, households with no vehicles available made fewer trips per household than those households with vehicles available to them. The average number of household trips made increases up until the 3 available vehicles level, after which this trend appears to level off and show a comparable average number of trips per household for

households with 3 or more vehicles. Note that households with no vehicle available make a meaningful number of trips.

**Figure 14. Household Trip Rates by Number of Vehicles Available.**

Table 2 shows the person trip rates cross classified by household size and household income for all internal trip purposes combined, that is, trips that begin and end inside the household travel survey area. These trip rates are for all trips by all modes including transit, bicycle, and walk trips. For travel forecasting applications, the cross-classified trip rates are disaggregated by trip purpose into HBW trips, HBNW trips, and NHB trips (see the terminology section for the definitions of these terms). As a part of the travel forecasting process, the person trips are divided among the modes during the mode split step. The average person trip rate, internal to the planning area, for all households was 9.6 person trips per household.

### Travel by Age Cohort

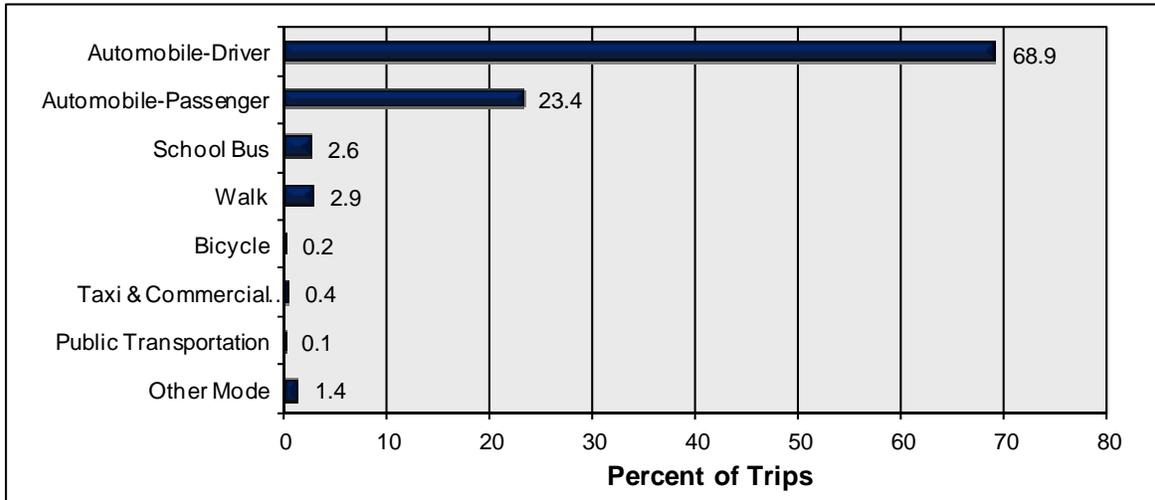

A total of 335,963 persons were represented in the expanded household survey based on persons who reported their age. Table 4 shows the number of persons and distributions of persons by age cohort that did not make any internal trips on their survey day. As expected, older persons are less likely to travel than are younger persons, but the older population is mobile and contribute significantly to the amount of household travel.

**Table 4. Number of Persons, Percent of Persons, and Percent of Persons Making Zero Trips by Age Cohort.**

### **MODE OF TRAVEL**

The modes of travel were household automobile-driver, household automobile-passenger, school bus, walk, public transportation, bicycle, carpool/vanpool, and commercial vehicle. Figure 15 provides the distribution of person trips by mode. Automobile travel accounted for 92.2 percent of the person trips. Interestingly, taxi and commercial vehicle trips combined accounted for only 0.4 percent of the person trips and the “walk” mode accounted for slightly less than 3 percent of the person trips. The surveyed households made little use of public transportation, accounting for only 0.1 percent of person trips.

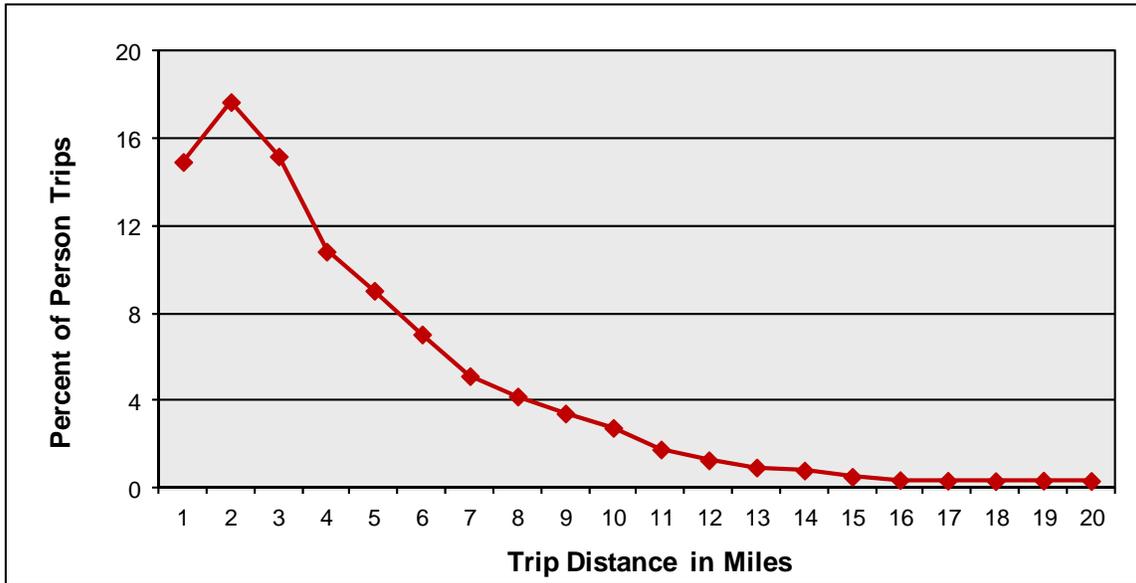

**Figure 15. Distribution of Person Trips by Mode of Travel.**

## AMOUNT OF TRAVEL

Several measures are used to record the amount of travel—the number of person trips, the number of vehicle trips, the trip distances in miles, the trip durations or travel times in minutes, and the VMT.

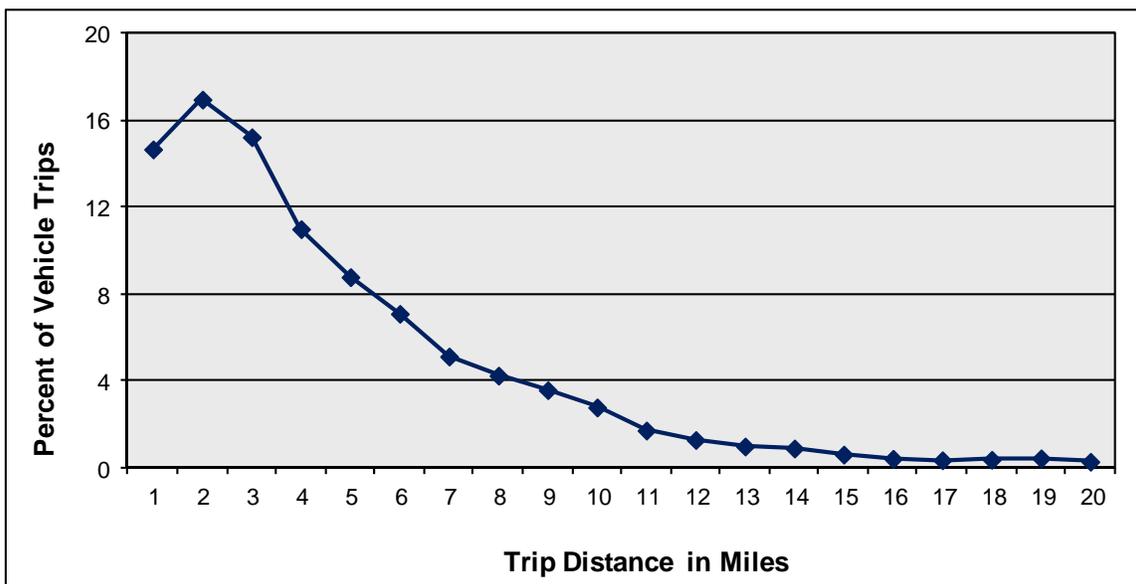

### Trip Distance

Figure 16 shows the distribution of person trips by the length of the trip in miles. The distribution is for internal person trips, trips beginning and ending inside the study area. The average person trip length was 5.1 miles.

**Figure 16. Distribution of Person Trips by Trip Distance in Miles.**

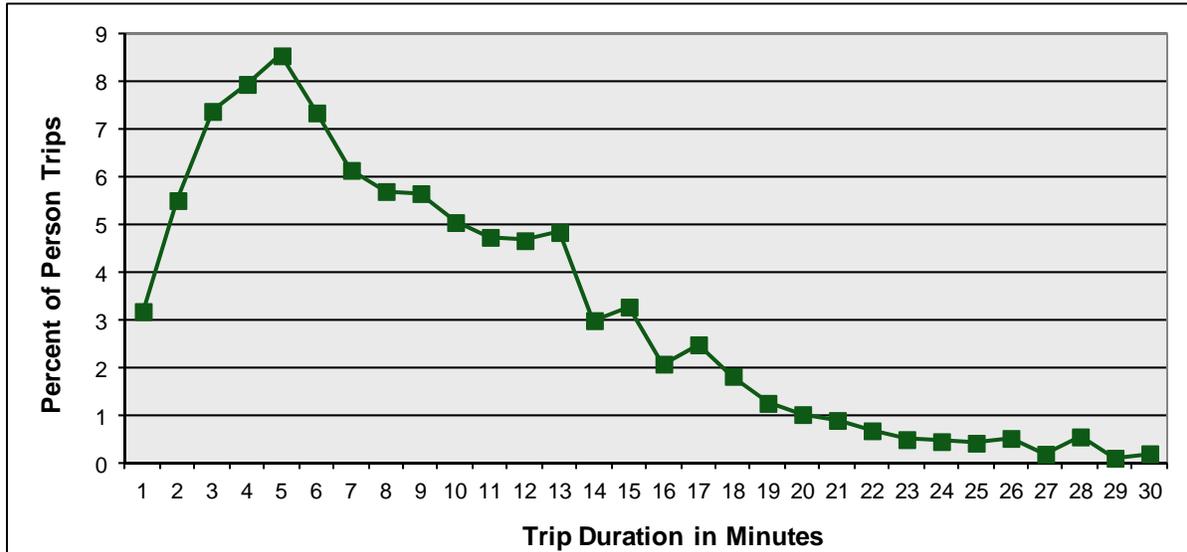

Figure 17 provides the distribution of vehicle trips by the length of the trip in miles. For travel demand modeling purposes, the travel modeler needs data about the distribution of vehicle trips in miles and the average vehicle trip length in miles for each internal trip purpose. The average vehicle trip length was 5.4 miles. Distributions similar to Figure 17 are prepared for each internal trip purpose.

**Figure 17. Distribution of Motorized Vehicle Trips by Trip Distance in Miles.**

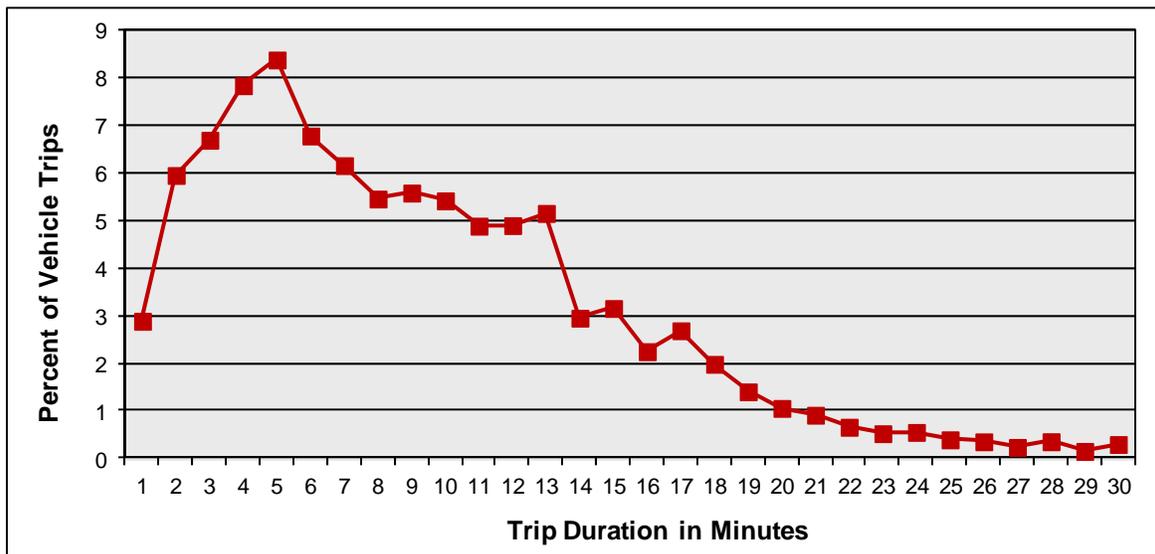

### Trip Duration

Figure 18 shows the distribution of person trips by the duration of the trip in minutes. The distribution is for internal person trips, trips beginning and ending inside the three-county study area. The average person trip duration was 10.1 minutes.

**Figure 18. Distribution of Person Trips by Trip Duration in Minutes.**

Figure 19 presents the distribution of vehicle trips by the duration of the trip in minutes. The average vehicle trip duration was 10.3 minutes.

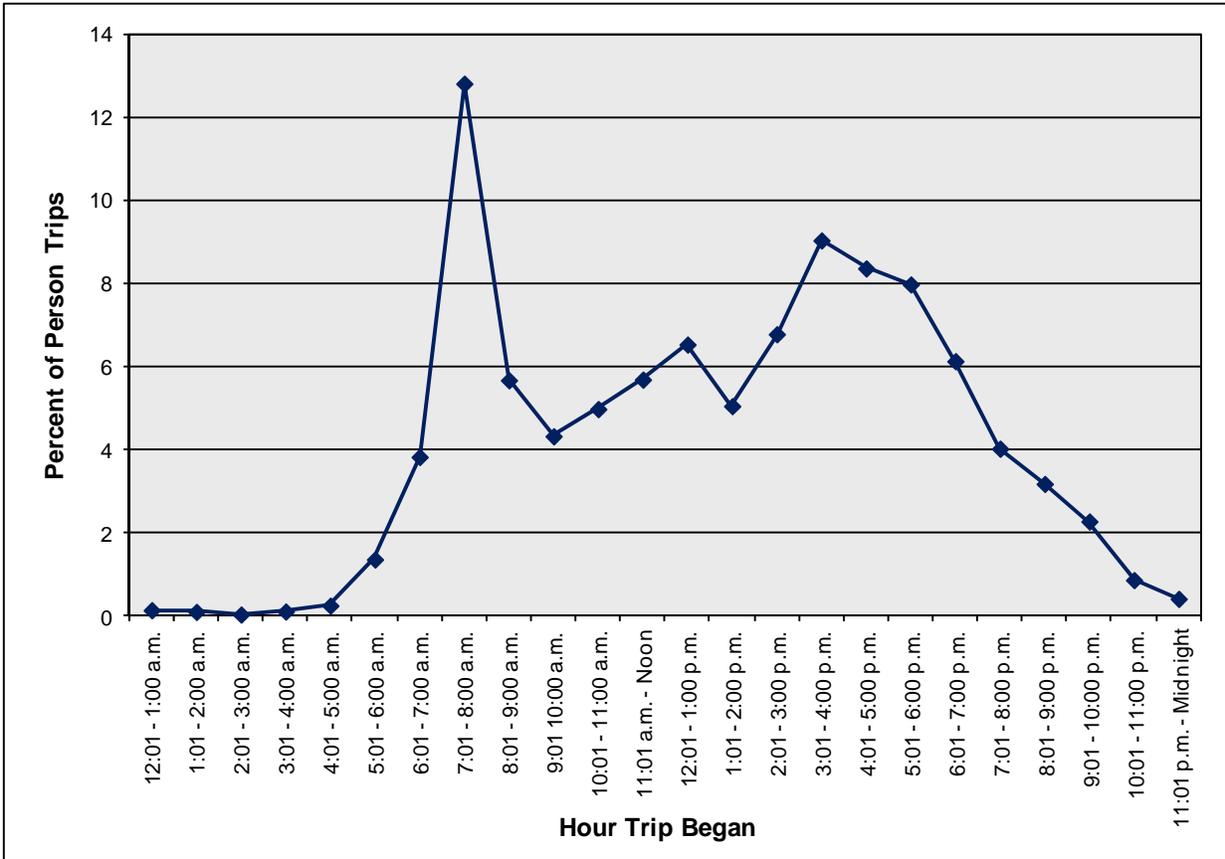

**Figure 19. Distribution of Motorized Vehicle Trips by Trip Duration in Minutes.**

## **Vehicle Miles of Travel**

VMT is calculated as the product of the average vehicle trip length in miles and the number of vehicle trips. For household trips internal to the study area, the estimated VMT was 4.29 million miles per school-year weekday. This is not the total VMT for the study area, as the VMT associated with external-local, external-through, commercial vehicle, visitor travel, and intrazonal trips are not included in the estimate.

## **TIME OF TRAVEL**

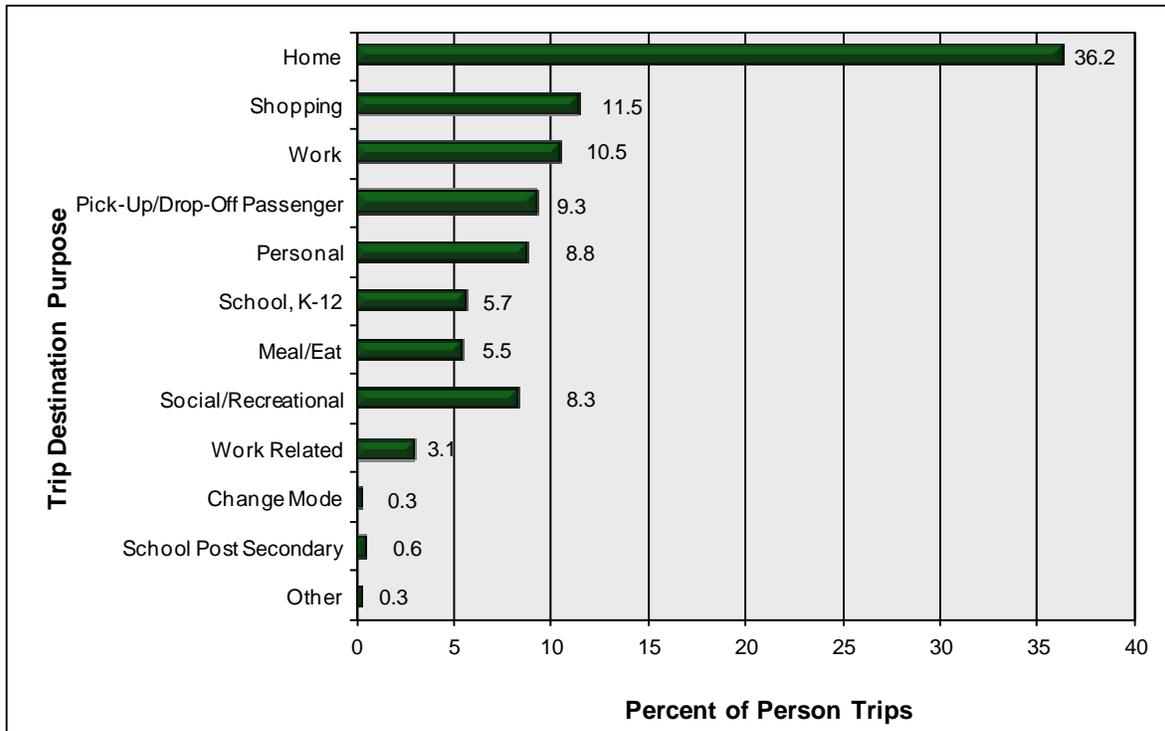

The time of travel is a function of the activity to be accomplished. The start times for trips to work and to school are dictated by the time that work and school begin. For other activities, such as trips to shop or for recreation, the trip start times are flexible. As travel during peak period becomes more congested, some drivers choose to make trips earlier or later to avoid the most congested travel time. Figure 20 shows the distribution of trip start times for a 24-hour weekday during the school year. The morning peak period, 7:01 a.m. to 8:00 a.m., has the highest percentage (12.8) of daily trip starts. During the morning peak period, trips from home to work and from home to school are the primary destinations. The second highest percentages (9.0) of trip starts occur during the hours of 3:01 p.m. to 4:00 p.m. During this hour, trips from school to home are the primary destinations. Trip starts during the hour from 4:01 p.m. to 5:00 p.m., which are trips from work to home, has the third highest percentage (8.37) of daily trip starts.

**Figure 20. Distribution of Person Trip Start Times by Hour of the Day.**

**TRAVEL PURPOSE**

As a part of their travel diary, each household member was asked to identify from a list of choices what they did at each trip destination. The information about the trip destination was used to categorize the trip by trip purpose. In travel demand modeling, typically there are three internal trip purposes—HBW, HBNW, and NHB trips. Figure 21 shows the distribution of person trips by the trip destination purposes used in the survey. As would be expected, the most frequent trip destination was the return home trip.

**Figure 21. Distribution of Person Trips by Destination Purpose.**

### **Type of Place at Trip Destination**

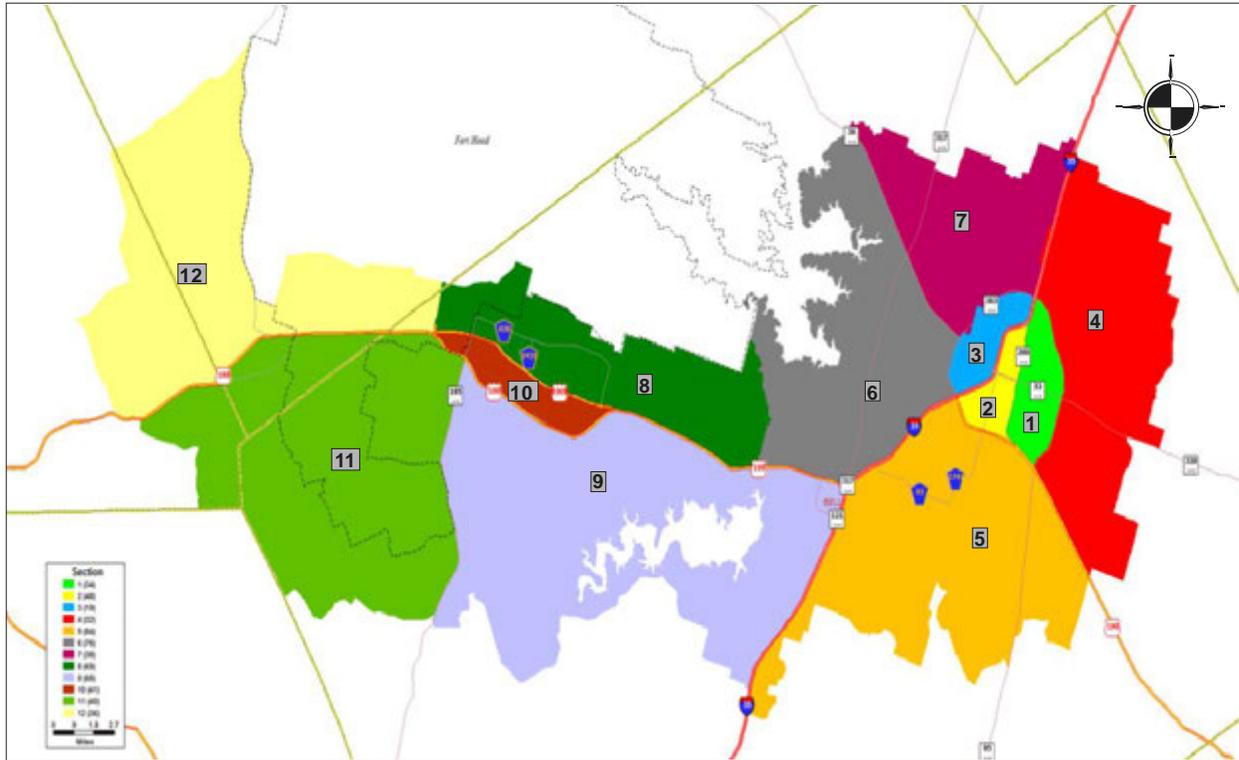

Closely related to the travel purpose and what the traveler did at the destination end of the trip is information on the type of place or business that was at the destination end of the trip. This information is used by the travel demand modeler to develop trip attraction rates for various types of land use. In travel demand modeling, attractions are typically grouped into three categories—basic, retail, and service. Table 5 shows the distribution of person trips by the types of places identified in the survey for the destination end of the trip.

**WHERE PEOPLE TRAVELED**

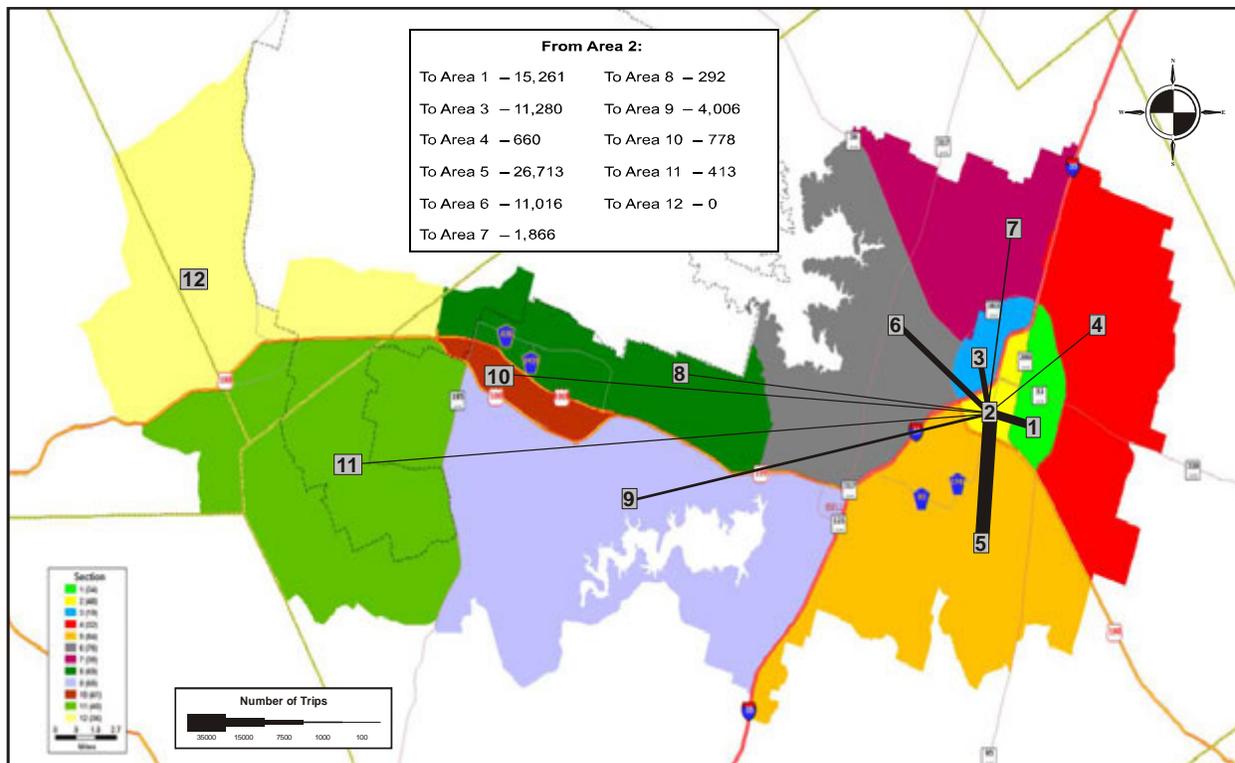

The KTUTS study area was divided into 12 sub-regions, shown in Figure 22, to generally illustrate the geographic distribution of internal person trip movements within the region. The number of person trip interchanges between each sub-region and all other sub-regions is illustrated in Figure 23 through Figure 34. The general amount of travel between each sub-region within the region is reflected by the width of the line between each subarea. The wider the line, the greater the amount of travel movements between the sub-regions. The final figure in this sequence, Figure 35, shows the percent of person trips that remained within each sub-region.

## **SUMMARY DATA**

Table 6 shows the household survey summary data for the KTUTS planning area and for travel surveys conducted in a few other study areas in Texas. More detailed data than provided in this report has been provided to TxDOT's TPP Division for their use in updating the KTUTS area travel demand model.

## TERMINOLOGY

Within the context of the household travel survey, a number of terms are used. These terms are defined in this section.

*Person Trip* – A person trip is the movement of an individual from one location to another location. In the household survey, trips were recorded for all persons in a surveyed household.

*Automobile Driver Trip* – An automobile driver trip is the movement of a vehicle from one location to another location. These trips are recorded for the person driving the vehicle. These are also referred to as vehicle trips.

*Trip Purpose* – The trip purpose is stated in terms of the purpose at the location the trip began and the purpose at the location the trip ended. For example, a trip that began at home and ended at work would be referred to as a home-based work (HBW) trip. There are three primary trip purposes used in the household survey. These include HBW, home-based non-work (HBNW), and non-home based (NHB).

*Trip Activity* – The trip activity is stated in terms of the activity at the location the trip began and/or the location the trip ended. There are 22 activities used in the household survey. The activities were recorded in the survey and post processed to identify the trip purpose associated with each trip activity.

*Vehicle Availability* – Vehicle availability is the number of vehicles available to members of a household for making trips.

*Vehicle Occupancy* – Vehicle occupancy is the number of occupants in a vehicle during a vehicle trip including the driver of the vehicle.

*Mode of Travel* – Mode of travel is the physical means used by the household member to make a trip. The modes are walk, vehicle driver, vehicle passenger, carpool driver, carpool passenger, vanpool driver, vanpool passenger, commercial vehicle driver, commercial vehicle passenger, public transportation, school bus, taxi/paid limousine, bicycle, motorcycle/moped, and other.

Home-Based Work (HBW) Trip – An HBW trip is a trip that has one end of the trip at home and the other end of the trip at work. An HBW trip is non-directional in terms of the trip activity/trip purpose, i.e., a trip from home to work or from work to home is defined as an HBW trip.

Home-Based Non-Work (HBNW) Trip – An HBNW is a trip with one end of the trip at home and the other of the trip at a location other than the work location. An HBNW trip is non-directional in terms of the trip activity/trip purpose.

Non-Home-Based (NHB) Trip – An NHB trip is a trip with neither end of the trip at home.

Trip Productions – Trip productions are the number of trips produced by members of a household. Trip productions are calculated by trip purpose and mode of travel. Production rates are the number of trip productions divided by the number of households that produced those trips.

Trip Attractions – Trip attractions are the number of trips attracted to a particular category of land use. Trip attractions are calculated by trip purpose and mode of travel for different land use categories.
