Abstract

Karst feature habitat surveys were conducted within the Loop 1604 right of way and easements from one mile west of State Highway 16 (SH 16) to Interstate 35 (I-35) and within the Interstate 10 (I-10) right of way and easements from Farinon Drive to Camp Bullis Road in Bexar County, Texas between May 2019 and September 2019. A literature review included the right of way, easements, and a 345-foot radius. No requests to enter private property outside of easements were made as a part of this effort.

Surveys and literature review identified 567 potential karst features (not accounting for potential synonyms), 107 of those occurring within rights of way and easements where they could be accessed for additional evaluation. Accessible features were evaluated for their potential to contain karst invertebrate habitat. Presence/absence surveys conforming to current U.S. Fish and Wildlife Service protocols were conducted in 18 features. One of those sites, feature 1604-FZ7, yielded an eyeless spider determined with mitochondrial DNA analysis to be part of the clade with the non-listed *Cicurina platypus/bullis*. No additional *Cicurina* sp. localities were discovered as a part of this effort.

Features previously documented to contain federally listed endangered karst invertebrate species include Green Mountain Road Cave (1604-E09), La Cantera Cave No. 1, and La Cantera Cave No. 2; however, only Green Mountain Road Cave occurs within the right of way. In addition to these three known localities, the 345-foot radius overlaps with Critical Habitat Unit 9; however, does not overlap with the caves and features in that unit that are known to contain listed species. No new endangered species localities were discovered as part of this effort.

Appendix F. Vegetation Sketches

Introduction

The Texas Department of Transportation (TxDOT) is proposing improvements to Loop 1604 from State Highway 16 (SH 16) to Interstate 35 (I-35) in Bexar County, Texas. The Project Area is the TxDOT owned right of way (ROW) plus easements that encompass the project construction limits, and the Action Area is a 345 ft. radius around the Project Area. The Action Area includes the Stone Oak and UTSA Karst Fauna Regions (KFRs), occurs in karst zones 1, 2, 3, and 5, and overlaps with Critical Habitat Unit (CHU) 9 (Figure 1).

Most of the geographic area covered in this report was previously examined for its potential to provide karst invertebrate habitat (TxDOT 2015a), and a Biological Opinion with an Incidental Take Statement for *Cicurina madla*, *C. baronia*, *Rhadine exilis*, and *R. infernalis* was issued for an earlier iteration of this project (U.S. Fish and Wildlife Service [USFWS] 2016). The purpose of this study is to provide a current and comprehensive examination of karst invertebrate habitat and species in the Project Area.

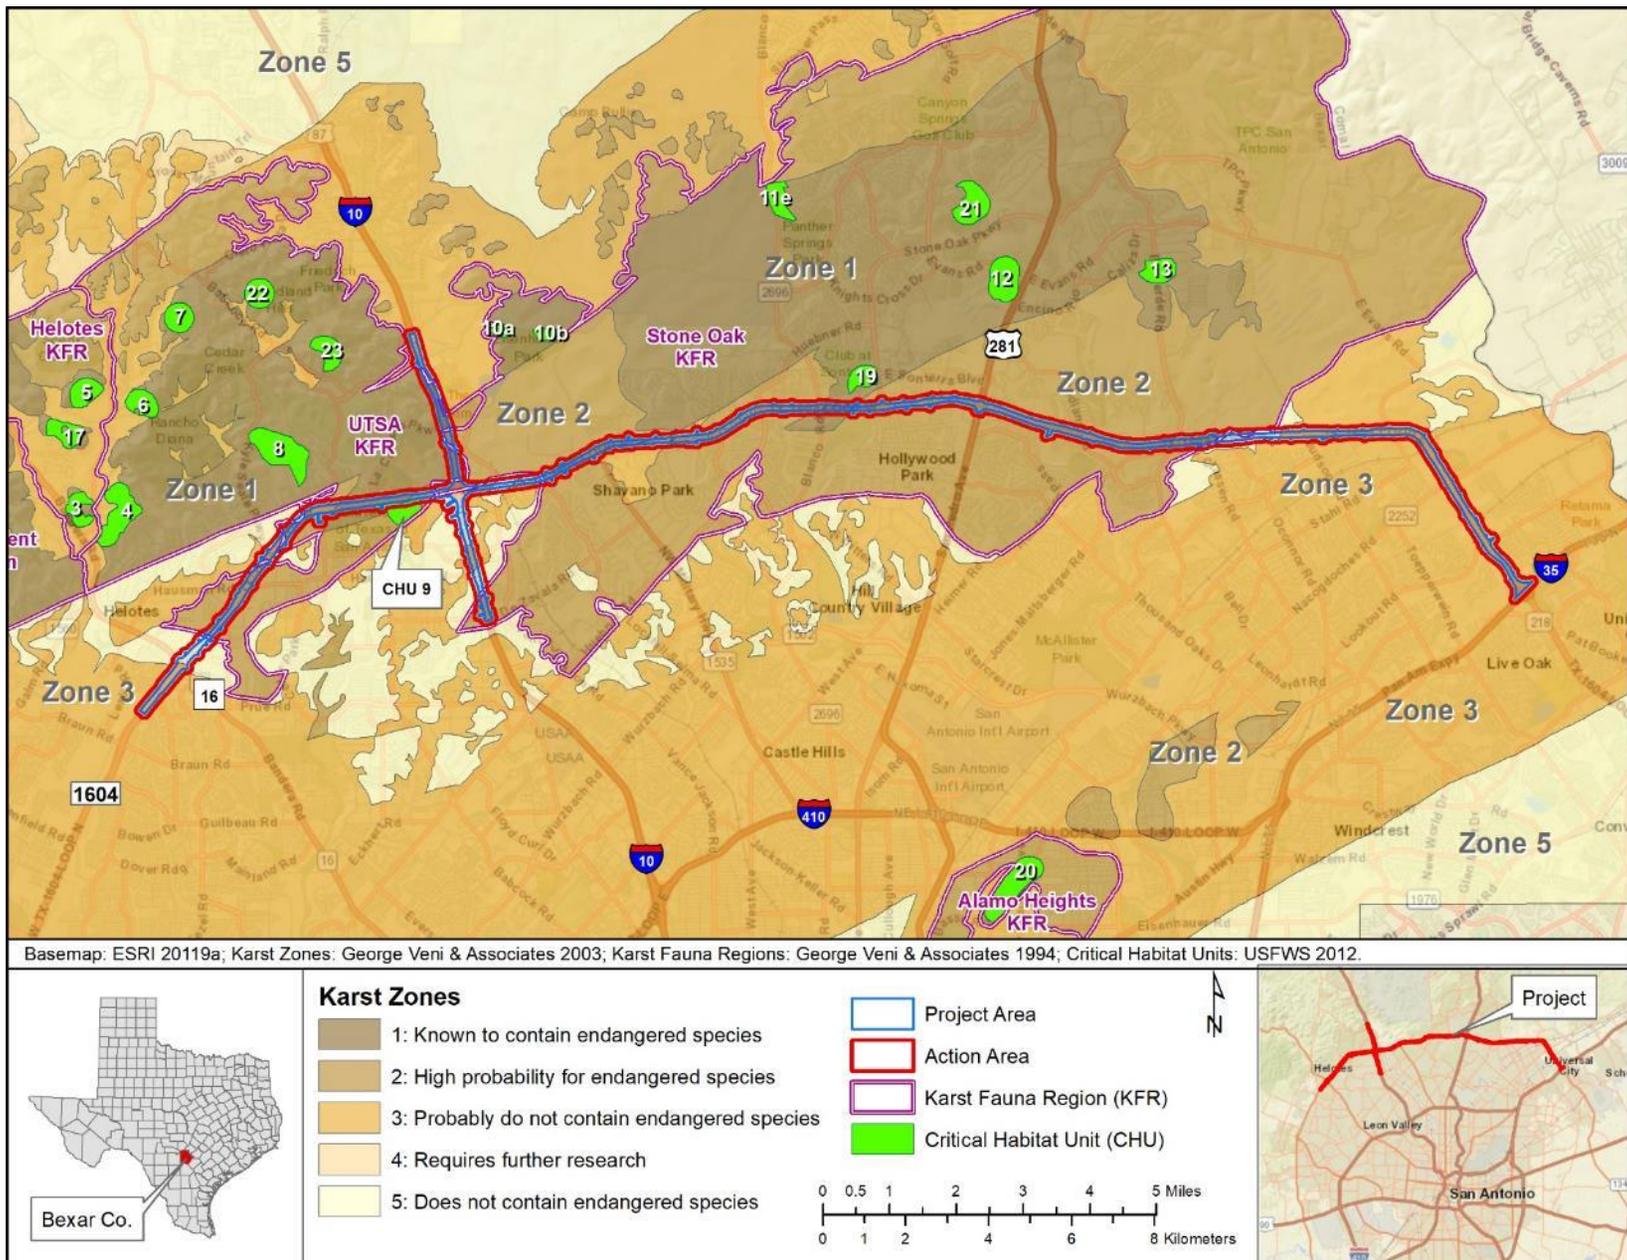

Figure 1. TxDOT is proposing improvements to Loop 1604 from SH 16 to I-35 and I-10 from Farinon Drive to Camp Bullis Road in Bexar County, Texas.

Methods

Background Data Collection

A review of karst feature and species location data from within the Action Area relied on the following sources:

- Texas Speleological Survey (TSS),
- USFWS,
- Texas Memorial Museum,
- Texas Parks and Wildlife Department, Texas Natural Diversity Database (TXNDD),
- Southern Edwards Plateau Habitat Conservation Plan (SEP HCP) administrators, and
- Completed geologic assessments (GAs) and karst technical reports from within the Action Area.

These historic data were compiled into a GIS database, and features located within the Project Area were identified for in-person evaluation.

Karst Feature Survey and Evaluation

Fieldwork for the karst survey was conducted from May 2019 through September 2019 and was supervised by USFWS permitted biologists and Professional Geoscientists. Surveys were conducted within the Project Area, except for three areas where very recent GAs were suitable for the baseline feature dataset (TxDOT 2017, TxDOT 2018a, TxDOT 2018b). Landowners were notified by mail that scientists would be conducting surveys within the easements.

Survey methods followed protocols outlined in Veni and Reddell (2002), Barrett (1999), Texas Commission on Environmental Quality (TCEQ) (2004) and USFWS (2015a), which describe surveyors walking in a formation not more than 15 m (50 ft) apart searching for depressions (both karstic and non-karstic), voids, and other indications of subterranean habitat. In addition to identifying previously undocumented features, careful effort was made to locate and re-evaluate the status of previously documented features. Positions of all features were documented using cell phone GPS or Garmin 64s GPS receivers and checked with field maps based on digital ortho-imagery. All features were mapped using ArcGIS software.

Karst features in the Project Area were evaluated by USFWS 10(a)(1)(A) permit holders. Reconnaissance excavation was performed when necessary, and features were evaluated based on USFWS (2015a) guidelines to determine whether they had the potential to contain habitat for federally listed karst invertebrate species. The evaluated features were documented and sketched on field sheets and are described in this report.

Personnel involved with field work and/or reporting included USFWS 10(a)(1)(A) permit holders (Permit No. TE85077A-0) Rachel Barlow, Brian Cowan, Jeanette Joost, Jean Krejca, William Larsen, Krista McDermid, and Peter Sprouse. Non-permitted scientists working under the direct supervision of permitted scientists to provide additional safety support and assisting with data collection and management included: Jennifer Blair, Liza Colucci,

Vanessa Curiel, Wendy Dickerson, Aubri Jenson, Jeremy Maikoetter, David McBee, Jacob Owen, Lucas Pustka, Tyler Remick, Caitlyn Wagner, Jeff Watson and John K. Young.

Presence/Absence Surveys

Features that met criteria described in USFWS (2015a) as having the potential to contain habitat were subject to presence/absence surveys, which were guided by recommendations in USFWS (2015a) and included an examination of all floors, walls, ceilings, and the undersides of rocks or loose substrate. Trapping methods were used to increase the potential for species detection, and the specific trapping regime for each feature is described as a part of each feature's results. Data loggers (Kestrel Drop D2[®], Nielsen-Kellerman, 21 Creek Circle, Boothwyn, PA 19061, and SensorPush, HT1 Temperature and Humidity Smart Sensor, Garrison, NY 10524) were installed in the features and set to record in-cave temperature and relative humidity every 30 minutes. Features were insulated and covered with opaque plastic sheeting and plywood in between sampling events to buffer against surface temperature and humidity influences.

Fauna Identification

Fauna encountered were noted on field sheets and specimens were collected for confirmation when practicable. Excepting eyeless *Cicurina* spiders, commonly collected specimens were deposited with the University of Texas Biodiversity Collections at the University of Texas at Austin, unless otherwise noted. Eyeless *Cicurina* spiders were collected and sent to taxonomic specialists because they could not be identified in the field. Three legs were removed from each specimen and submitted to Dr. Caleb Phillips, Curator of Genetic Resources, Natural Science Research Laboratory, Museum of Texas Tech University. The remaining material from each specimen was sent to *Cicurina* taxonomic specialist Dr. Marshal Hedin, San Diego State University. This specimen disposition was approved by USFWS by email as an amendment to the Zara Environmental 10(a)(1)(A) permit on 20 May 2019. The results of those identifications are detailed in the results section for each feature.

The fauna observation tables in this document provide identifications down to the most convenient taxonomic level, typically order but sometimes family or genus. In all cases the taxa are epigeal (surface) dwellers or troglonenes or trogloniles unless noted in the feature description. For example, 'Araneae' and 'Coleoptera' are surface spiders and beetles, definitively not cave adapted species. Cave adapted species are identified to the genus level at a minimum and are specifically noted in the text.

Results

Background Data

Data from the following sources were found to contain pertinent information, and the details are presented in the feature descriptions section:

- Karst technical reports (Zara Environmental LLC [Zara] 2010b, Zara 2012, TxDOT 2015a, TxDOT 2019a),
- GAs (Zara 2010a, TxDOT 2015b, 2017, 2018a, 2018b, 2018c),
- The biological assessment for the Loop 1604 interchange at Blanco Road (TxDOT 2019b). A review of TxDOT 2019b (Table 3-2, pages 23-25 in that document) indicates that approximately 28 of the features described in this document are slated to be mined away as part of construction scheduled to occur between 2021 and 2025.

Data requests from USFWS, Texas Memorial Museum, TXNDD, and SEPHCP did not yield any new data relating to feature locations or endangered species localities. Data returned from TSS provided most of the information for features outside of the Project Area, but no new endangered species localities. The research on previous GAs summarized by TxDOT (2015a) provided the remainder of information for features outside of the Project Area (Appendix A).

Feature Evaluation, Excavation and Biological Surveys

Within the Action Area, 31 features have karst invertebrate habitat (Table 1), including three sites previously known to contain federally listed species: La Cantera Cave No. 1, La Cantera Cave No. 2, and Green Mountain Road Cave (Figure 2). No new endangered species localities were discovered as part of this current effort.

One hundred seven features were evaluated from the Project Area (Table 2).

Presence/absence surveys conducted in 18 features resulted in the documentation of common troglobites (including *Texoreddellia* sp., *Brackenridgia* sp., *Chinquipellobonus* sp. and *Cambala* sp.), a range extension for a rare troglobite (Schizomida), and a new eyeless *Cicurina* locality in feature 1604-FZ7. Taxonomic experts used mitochondrial DNA (mtDNA) to identify the 1604-FZ7 animal as *C. platypus/bullis*, a non-listed *Cicurina* species. A previously collected eyeless *Cicurina* from feature JCT-26-NB (5) was also analyzed with mtDNA and found to be *C. puentecilla*. Results of all fauna surveys by feature and date are included in Appendix B. The genetic determination report is included in Appendix C. In-cave climate data for the features with presence/absence surveys are included as Appendix D. Detailed map views of feature locations are included as Appendix E. Vegetation sketches of surveyed features are included in Appendix F.

Features not described in this report include:

- GA-only features (e.g. faults, fractures in streambeds, and non-karst closed depressions) (Table A-1, Appendix A)
- Historic features not found and known to not contain species habitat (typically these are from previous GAs and are no longer extant),
- Features destroyed by ongoing construction projects in the area and not known to contain species habitat,
- Features located outside of the Project Area (typically these are from TSS data searches or previous GAs) (Table A-2, Appendix A).

Feature 1604-801; Zone of Solution-Enlarged Fractures

This feature was located in the roadcut north of the westbound mainlanes of Loop 1604 east of Huebner Road (Figure 3 - Figure 5). It was evaluated on February 2, 2010, and on March 25, 2010 excavation was performed, and the feature was found to definitively end. The feature was again field evaluated on November 29, 2017, and the original datasheets were re-evaluated in 2019 to verify the potential for karst invertebrate habitat. It was a zone of three solution-enlarged fractures within an area that was 6 m (20 ft) wide by 1.8 m (6 ft) long by 1.8 m (6 ft) high. The largest opening was 0.5 m (1.5 ft) wide by 0.6 m (2 ft) high and extends 1.8 m (6 ft) into the roadcut (Figure 5). It contained exposed bedrock and breakdown. This feature was determined not to provide potential habitat for listed karst invertebrate species and no fauna surveys were performed (Table 2). A review of TxDOT 2019b and USFWS 2019 indicates that this feature may be removed during future construction at the Blanco Road intersection.

Feature 1604-CE2: Soil piping feature (currently backfilled)

This 0.35 m (1.15 ft) diameter by 0.35 m (1.15 ft) deep hole had a loose fill bottom that was dropping below grade due to soil piping (Figure 6 -Figure 8). This site was excavated on January 5, 2010, resulting in the removal of 3 m³ (105.9 ft³) of material. It was excavated to a depth of 3 m (9.8 ft). Initial digging efforts involved removing the loose fill from the piping shaft. While the vertical walls of the 0.35 m (1.15 ft) diameter shaft were composed of consolidated clay and small rocks, the piping material was sand. This sand was likely dumped in the hole at some point, but by whom or under what circumstances is unknown. As the hole deepened it was necessary to widen to continue working at the bottom, so the consolidated clay walls were peeled back to make the shaft a little over 1 m (3.3 ft) in diameter. A linear bedrock wall was found on the west side at a depth of 1.5 m (4.9 ft), and on the east side at a depth of 2 m (6.6 ft) (Figure 8). No bedrock was found on the north or south sides of the shaft. The feature began to resemble a bedrock utility trench; however, the walls exhibited a natural surface. Sand continued to be removed to a depth of 3 m (9.8 ft), where a poured concrete floor was encountered. Concrete residue could be seen on the east bedrock wall; evidence of it having been poured in to fill a natural bedrock feature. The north and south walls of the shaft, still composed of clay and small rocks but also small voids, was dug only as far as was prudent considering the risk of collapse due to unstable

overhang. Removal of this loosely consolidated material near the bottom resulted in the discovery of karst invertebrate species.

Presence/absence surveys for endangered karst invertebrates were conducted on January 6, 13, 20, and 27, and March 12 and 19, 2010. Karst invertebrate species encountered included *Cicurina neovespera* (Figure 9, Table 1), *Mixojapyx reddelli*, *Cambala speobia*, *Texoreddellia media*, *Pseudosinella violenta*, and *Brackenridgia cavernarum*. No endangered species were found. Since this feature was in a mowed area, the feature was backfilled after surveys were completed. In karst feature surveys conducted in 2019, no surface expression of the feature could be seen. It was not re-excavated, and new presence/absence surveys were not conducted. Re-excavation, even if the exact location of the feature could be determined, would be problematic. It would require a backhoe to excavate a large hole to avoid risk of collapse. The poured concrete at the bottom of the original excavation could indicate a plugged cave entrance or could be part of an unknown utility installation.

Figure 8. View down into CE2 after 2010 excavation. The bedrock walls on the east (bottom) and west (top) sides of the lower part of the feature can be seen.

Figure 11. Overview of feature 1604-D05.

Figure 12. Interior of feature 1604-D05.

Feature 1604-D06: Solution Cavity

This feature was located in a roadcut south of the eastbound mainlanes of Loop 1604, west of Blanco Road (Figure 13 - Figure 16). It was evaluated on January 12, 2010 and July 3, 2019. This solution cavity measured 0.2 m (0.65 ft) wide by 0.9 m (2.9 ft) long and 0.3 m (0.98 ft) high. It was floored with bedrock. It had no airflow and a definitive terminus. This feature was determined not to provide potential habitat for listed karst invertebrate species and no fauna surveys were performed (Table 2). A review of TxDOT 2019b and USFWS 2019 indicates that this feature may be removed during future construction at the Blanco Road intersection.

Figure 15. Entrance of feature 1604-D06.

Figure 16. Interior of feature 1604-D06.

Feature 1604-D07; Solution Cavity

This feature was located approximately 2 m (6.6 ft) above grade in the mainlane roadcut of eastbound Loop 1604, just west of Blanco Road. It was evaluated on January 12, 2010 and March 27, 2019 (TxDOT 2019a). It was a solution cavity 0.5 m (1.6 ft) wide by 1.5 m (4.9 ft) long by 0.3 m (1 ft) high (Figure 17). It contained bedrock and clay. During the initial evaluation in 2010, recon excavation was conducted, and no mesocavernous voids were detected. No fauna surveys were conducted. The 2019 evaluation determined that a small opening led to a new chamber in the feature. Minor rock excavation to facilitate entrance to the feature for surveys was conducted (Figure 18 - Figure 19). It was determined that this feature met criteria for potential habitat, including void size greater than or equal to 1 m (3.3 ft) and similarity to nearby caves (Table 2). Presence/absence surveys were conducted in March and April 2019; however, no troglobites were found (Table 1, Table 3) (TxDOT 2019a). A review of TxDOT 2019b and USFWS 2019 indicates that this feature may be removed during future construction at the Blanco Road intersection.

Feature 1604-D08; Solution Cavity

This feature was located in a roadcut south of the eastbound mainlanes of Loop 1604, east of Blanco Road (Figure 20 - Figure 22). It was evaluated on January 12, 2010 and July 3, 2019. This solution cavity measured 0.5 m (1.6 ft) wide by 0.5 m (1.6 ft) long and 0.3 m (0.98 ft) high. This feature had no airflow or mesocavernous voids. This feature was determined not to provide potential habitat for listed karst invertebrate species and no fauna surveys were performed (Table 2). A review of TxDOT 2019b and USFWS 2019 indicates that this feature may be removed during future construction at the Blanco Road intersection.

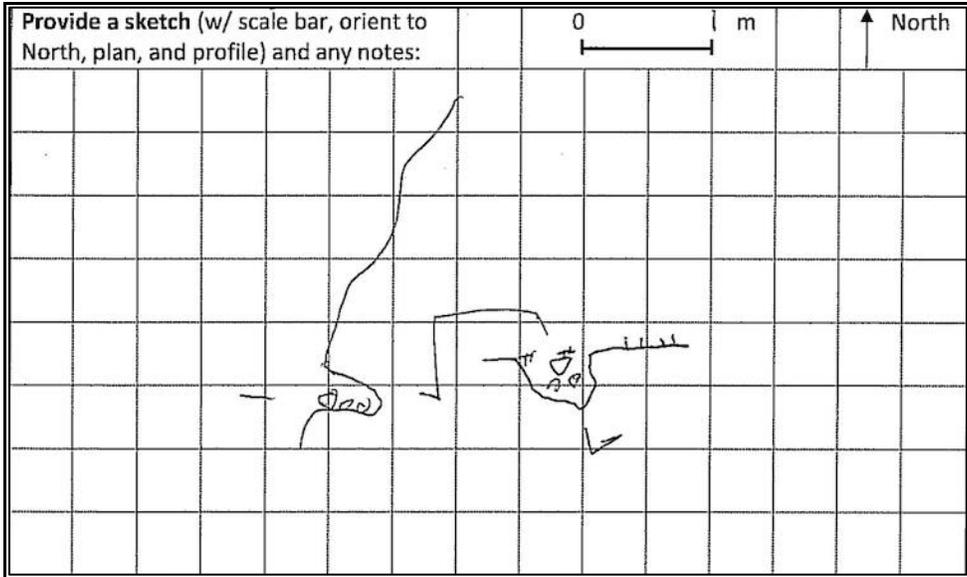

Figure 20. Field sketch of feature 1604-D08.

Figure 21. Overview of feature 1604-D08.

Figure 22. Interior of feature 1604-D08.

Feature 1604-D09; Solution Cavity

This feature was located in a roadcut north of the westbound mainlanes of Loop 1604, west of Blanco Road (Figure 23 - Figure 25). It was evaluated on January 12, 2010 and July 3, 2019. This solution cavity measured 0.6 m (1.9 ft) wide by 1.2 m (3.9) ft long and 0.5 m (1.6 ft) high. This feature was filled with fine loose soil and cobbles. This feature was determined not to provide potential habitat for listed karst invertebrate species and no fauna surveys were performed (Table 2). A review of TxDOT 2019b and USFWS 2019 indicates that this feature may be removed during future construction at the Blanco Road intersection.

Figure 24. Overview of feature 1604-D09.

Figure 25. Interior of feature 1604-D09.

Feature 1604-D10; Solution Cavity

This feature was in the mainlane roadcut of westbound Loop 1604, just west of the Blanco Road overpass. It was initially evaluated on January 12, 2010, and reconnaissance excavation was conducted. It was re-evaluated on March 25, 2019 (TxDOT 2019a) (Figure 26 - Figure 29). This solution cavity measured 0.3 m (1 ft) wide by 0.3 m (1 ft) long by 0.3 m (1 ft) high. It contained bedrock. It was located approximately 2.5 m (8.2 ft) above grade in the roadcut and had two openings. Boulders and rocks were removed from the outside to evaluate it. After this minor excavation, this feature was determined to end without any mesocavernous voids. This feature was determined not to provide potential habitat for listed karst invertebrate species and no fauna surveys were performed (Table 2). A review of TxDOT 2019b and USFWS 2019 indicates that this feature may be removed during future construction at the Blanco Road intersection.

Figure 29. Interior of lower hole of feature 1604-D10.

Feature 1604-D11; Solution Cavity

This feature was located in a roadcut north of the westbound mainlanes of Loop 1604, west of Blanco Road (Figure 30 - Figure 32). It was evaluated on January 12, 2010 and July 3, 2019. This solution cavity measured 0.7 m (2.3 ft) wide by 1.9 m (3.9 ft) long and 0.3 m (0.8 ft) high. It was infilled with gravel and compact red clay. This feature was determined not to provide potential habitat for listed karst invertebrate species and no fauna surveys were performed (Table 2). A review of TxDOT 2019b and USFWS 2019 indicates that this feature may be removed during future construction at the Blanco Road intersection.

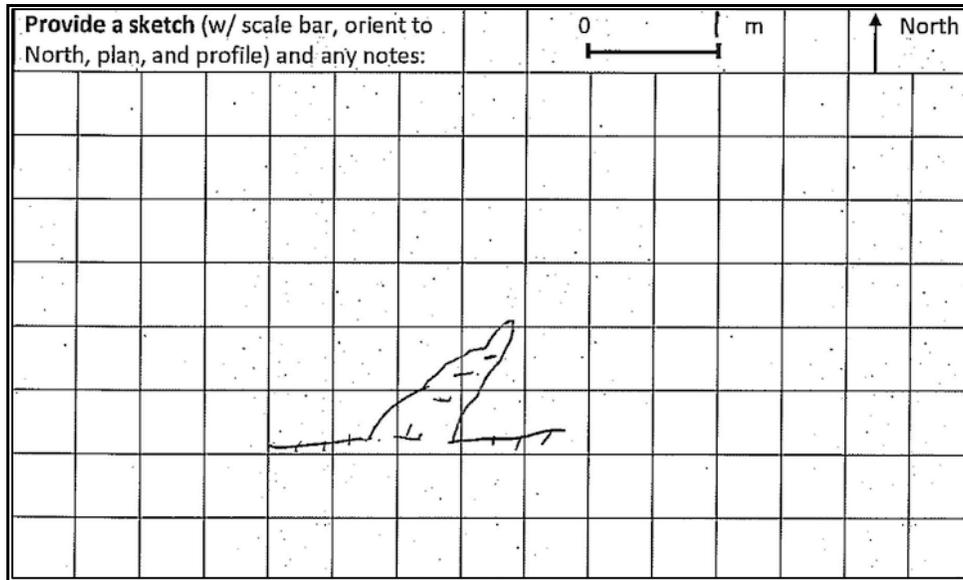

Figure 30. Field sketch of feature 1604-D11.

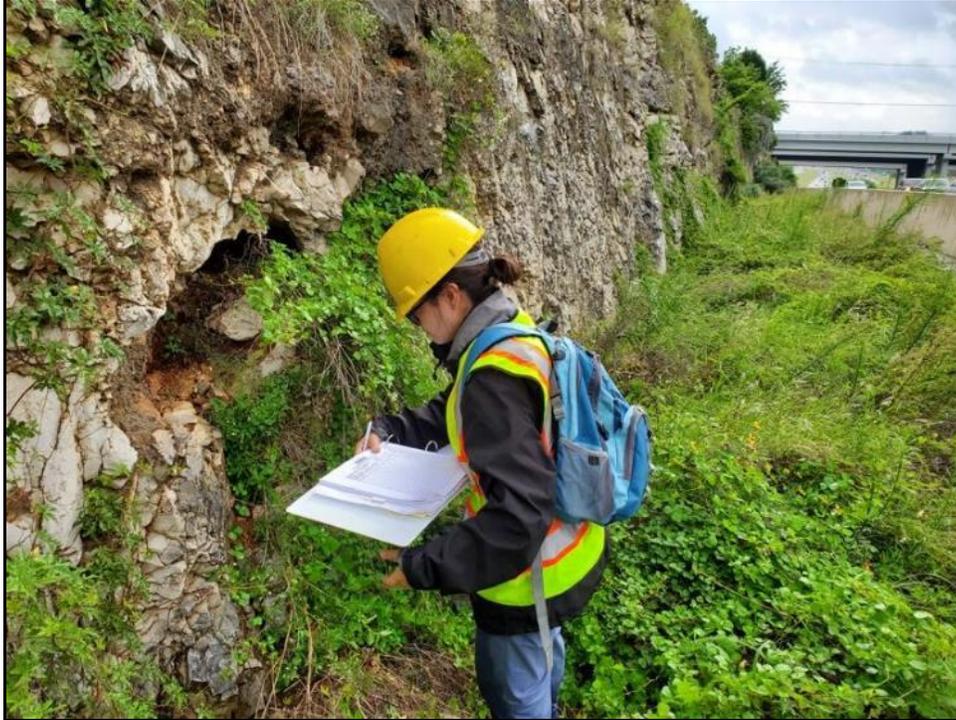

Figure 31. Overview of feature 1604-D11.

Figure 32. Interior of feature 1604-D11.

Feature 1604-D13: Enlarged Bedding Plane

This feature was located in the roadcut of the westbound 1604 mainlane between Blanco Road and Huebner Road. It was evaluated on January 12, 2010 and March 22, 2019 (Figure 33 - Figure 35). This enlarged bedding plane measured 3 m (9.8 ft) wide by 1 m (3.3 ft) long by 0.2 m (0.7 ft) high. It contained rocks, soil and bedrock. This feature had been exposed for several years and was dry with minimal dark space, and no visible mesocavernous voids. This feature had a visual terminus approximately 1 m (3.3 ft) into the roadcut. This feature was determined not to provide potential habitat for listed karst invertebrate species and no fauna surveys were performed (Table 2). A review of TxDOT 2019b and USFWS 2019 indicates that this feature may be removed during future construction at the Blanco Road intersection.

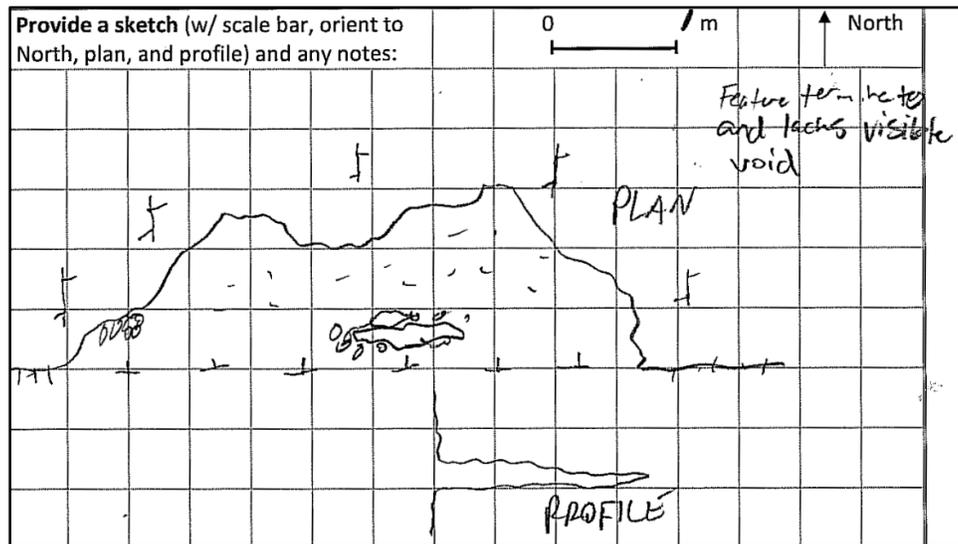

Figure 33. Field sketch of feature 1604-D13.

Figure 34. Overview of feature 1604-D13.

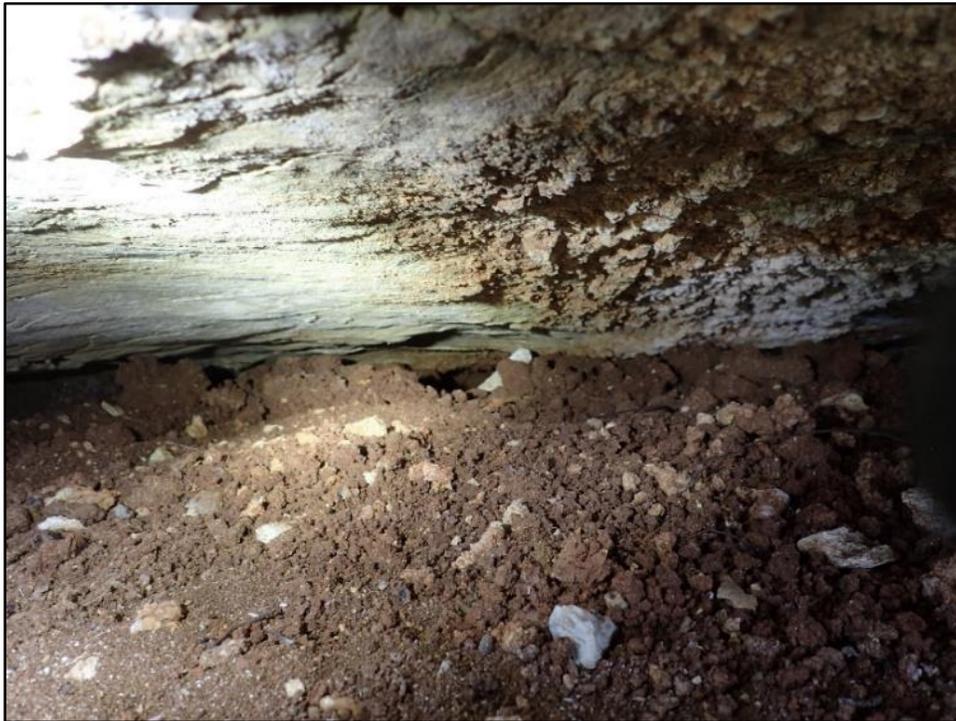

Figure 35. Interior of feature 1604-D13.

Feature 1604-D15: Solution-enlarged Fracture

This feature was located in the roadcut south of the eastbound mainlanes of Loop 1604 west of Huebner Road (Figure 36 - Figure 37). It was originally evaluated in 2010 (Zara 2010b), again in 2016, then again on August 15, 2019. This feature consists of two holes, one was a blind solution cavity, to the east, which had no voids extending from it. The other solution cavity measured 0.2 m (0.6 ft) in diameter at its opening, but inside measured 0.1 m (3.3 ft) wide and 0.3 m (1.0 ft) tall and extends 0.9 m (3.0 ft) into the roadcut. The floor of the feature had a thin layer of loose rocks and dark brown soil (Figure 38); however, it is best characterized as a tight, sinuous bedrock tube. Past evaluations noted that some void space can be seen continuing off from the feature, but during the 2019 evaluation we determined the maximum distance that could be sampled with a pole and sticky trap was less than one meter, and during this visit that space was entirely filled with a young possum. Excavation of the site was not warranted because it was nearly entirely bedrock with only a thin layer of loose debris available to move, such that excavation would not yield additional sampleable habitat. This feature was determined not to provide potential habitat for listed karst invertebrate species and no fauna surveys were performed (Table 2). A review of TxDOT 2019b and USFWS 2019 indicates that this feature may be removed during future construction at the Blanco Road intersection.

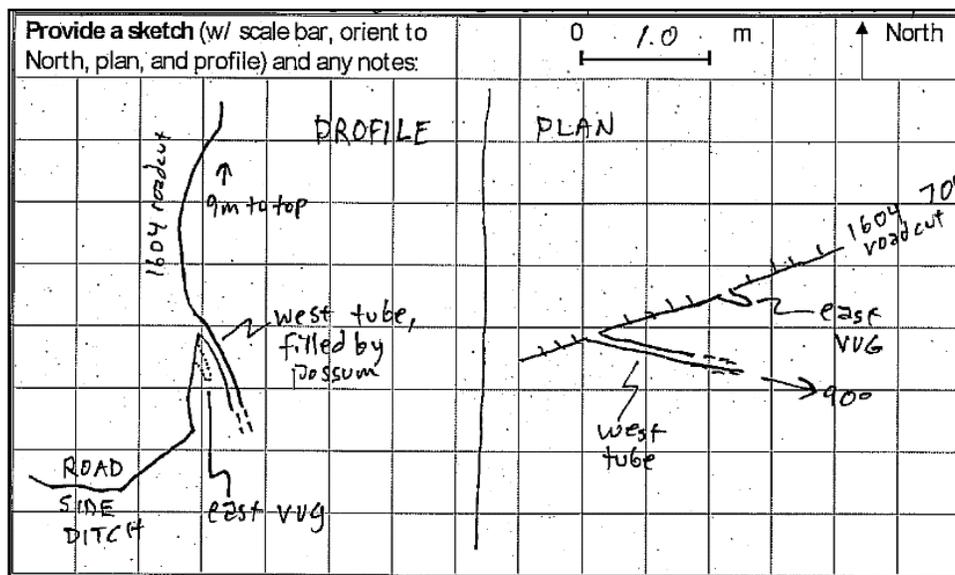

Figure 36. Field sketch of feature 1604-D15.

Figure 38. Interior of feature 1604-D15

Feature 1604-D16: Solution-enlarged Fracture

This feature was located in the roadcut south of the eastbound mainlanes of Loop 1604, west of Huebner Road (Figure 39 - Figure 41). It was field evaluated on January 13 and April 22, 2010, and on November 30, 2017. In 2019 the earlier datasets were re-evaluated to verify the potential for karst invertebrate habitat. It was a solution-enlarged fracture that measured 0.2 m (0.8 ft) wide by 0.9 m (3.1 ft) long by 0.3 m (1 ft) high, with no mesocavernous voids extending off. This feature was determined not to provide potential habitat for listed karst invertebrate species and no fauna surveys were performed (Table 2). A review of TxDOT 2019b and USFWS 2019 indicates that this feature may be removed during future construction at the Blanco Road intersection.

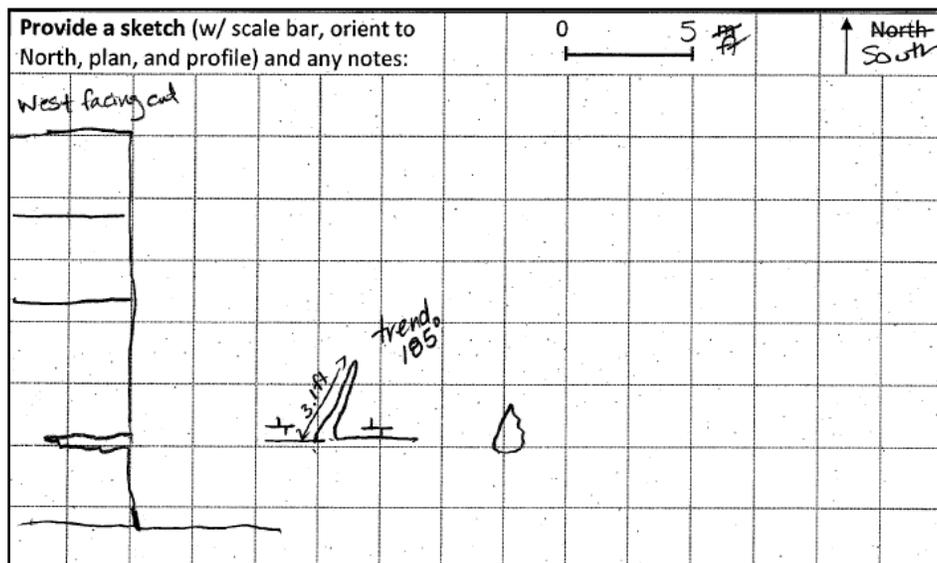

Figure 39. Field sketch of feature 1604-D16.

Figure 40. Overview of feature 1604-D16.

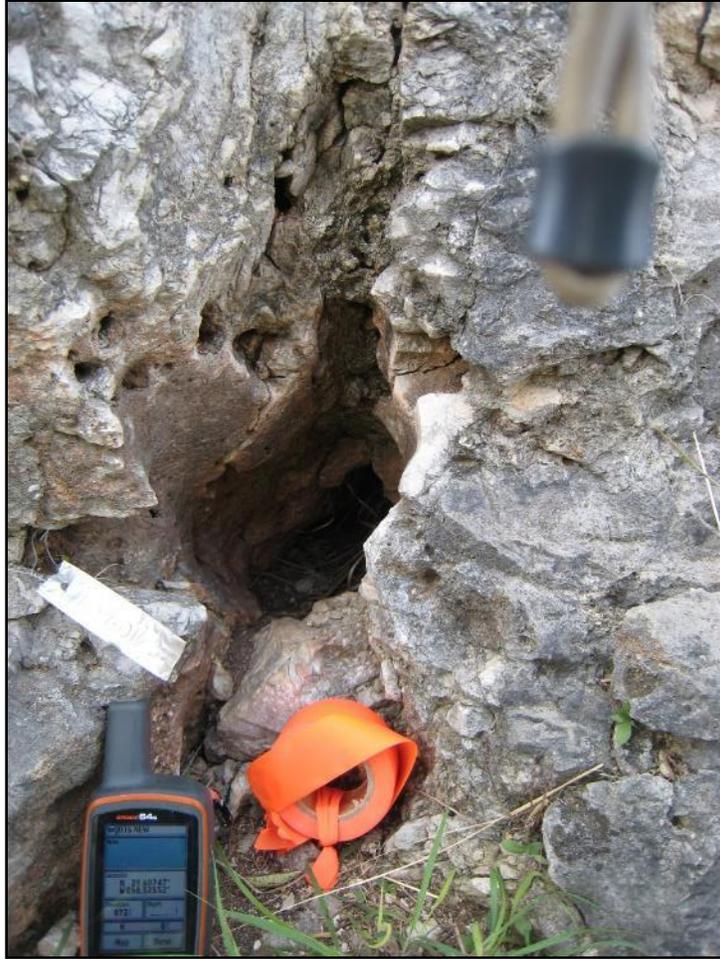

Figure 41. Interior of feature 1604-D16.

Feature 1604-D17; Solution cavity

This feature was located in a roadcut north of the westbound mainlanes of Loop 1604, west of Huebner Road (Figure 42 - Figure 44). It was evaluated on January 13, 2010 and June 19, 2019. This solution cavity measured 0.75 m (2.5 ft) long by 0.75 m (2.5 ft) wide and 0.25 m (0.8 ft) deep. This feature contained loose organic soil and leaf-litter. On August 19, 2010, approximately 0.5 person hours were spend excavating 0.1 m³ (3.5 ft³) of material using hand tools. Excavation was terminated after reaching a distinct floor that did not connect to any drains or mesocavernous voids draining downward. The feature was likely a bedding plane that was exposed by road cutting and then buried by ditch fill. This feature was determined not to provide potential habitat for listed karst invertebrate species and no fauna surveys were performed (Table 2).

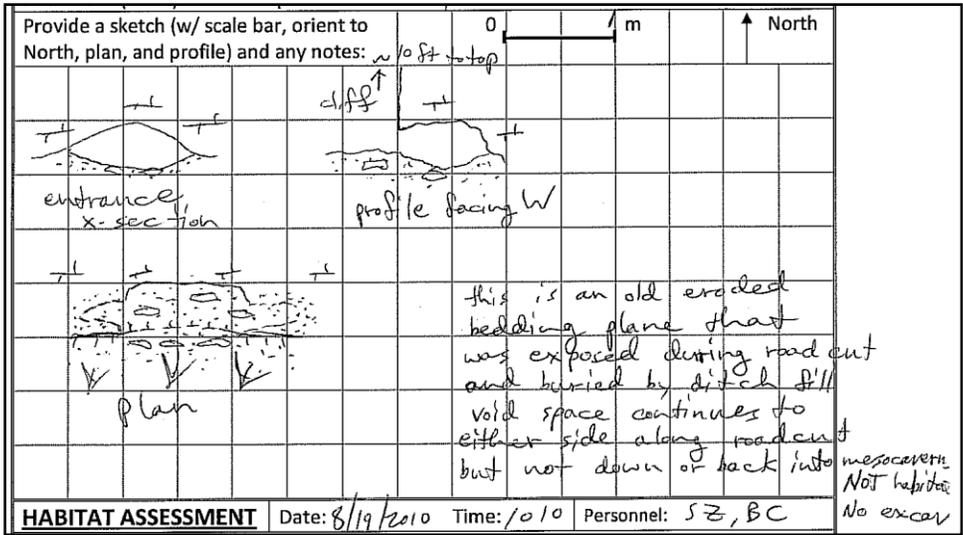

Figure 42. Field sketch of feature 1604-D17 after excavation in 2010.

Figure 43. Overview of feature 1604-D17.

Figure 44. Close-up of feature 1604-D17.

Feature 1604-D19; Solution-enlarged Bedding Plane

This feature was located in the roadcut north of the westbound mainlanes of Loop 1604 east of Huebner Road (Figure 45 - Figure 46). It was evaluated on January 13, 2010 and August 9, 2019. This feature was a solution-enlarged bedding plane 5 m (16.4 ft) wide by 2.5 m (8.2 ft) long by 0.2 m (0.5 ft) high. The feature contained rocks and exposed bedrock. The feature was located approximately 1.2 m (4 ft) above of the base of the roadcut. It was considered to be potential karst invertebrate habitat due to feature length and the presence of mesocavernous voids (Table 2). Biological surveys were conducted March and April 2010, but no troglobites were found. Presence/absence surveys were conducted in August and September 2019 (Table 4); however, no troglobites were found (Table 1).

Feature 1604-D20: Solution Cavity

This feature is located south of the eastbound mainlanes of Loop 1604, east of US 281 (Figure 47 - Figure 49). It was evaluated on January 13, 2010 and June 19, 2019. The feature was a solution cavity that measured 2.5 m (8.2 ft) wide by 0.5 m (1.6 ft long) and 1.2 m (3.9 ft) deep. This feature was floored with bedrock and desiccated due to the large opening. This feature was determined not to provide potential habitat for listed karst invertebrate species and no fauna surveys were performed (Table 2).

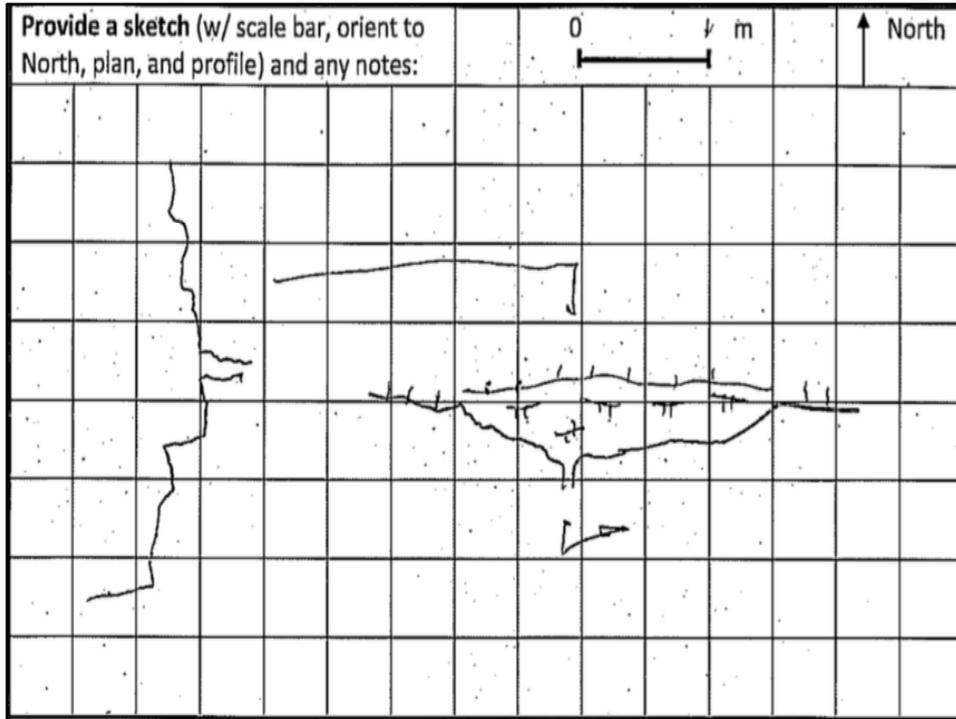

Figure 47. Field sketch of feature 1604-D20.

Figure 48. Overview of feature 1604-D20.

Figure 49. Close-up of feature 1604-D20.

Feature 1604-E04: Solution Cavity

This feature was located in a roadcut north of the westbound mainlanes of Loop 1604, east of Bitters Road (Figure 50 - Figure 53). It was evaluated on January 12, 2010 and July 3, 2019. The feature was a solution cavity 0.78 m (2.6 ft) wide, 1.4 m (4.6 ft) long, and 0.4 m (1.3 ft) high. This feature contained loose rocks and compact sediment. An excavation was performed on March 25, 2010, with the removal of approximately 1 m³ (35.3 ft³) of material using hand tools. Another excavation on July 10 and 11, 2019 resulted in 0.05 m³ (2 ft³) being excavated. This feature was determined not to provide potential habitat for listed karst invertebrate species and no fauna surveys were performed (Table 2). A review of TxDOT 2019b and USFWS 2019 indicates that this feature may be removed during future construction at the Blanco Road intersection.

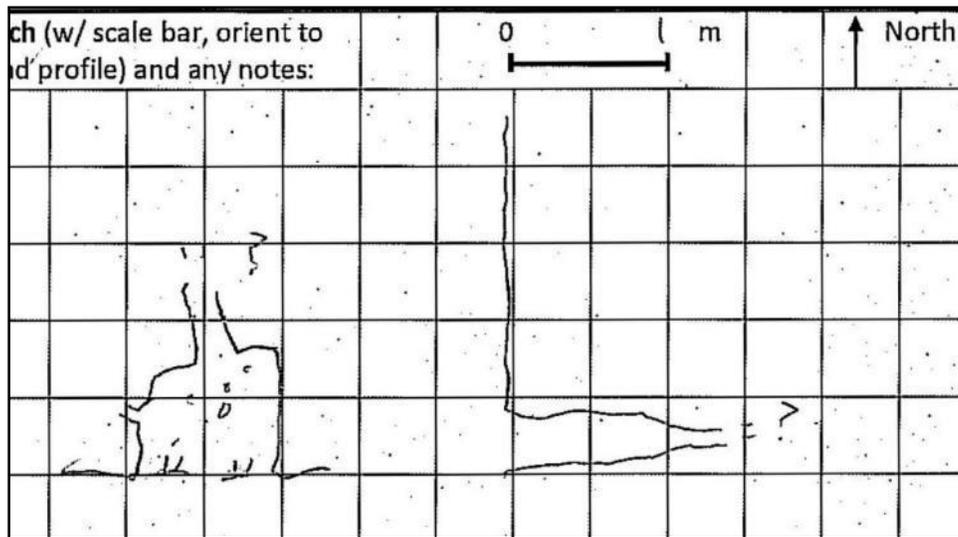

Figure 50. Field sketch of feature 1604-E04.

Figure 52. Overview of feature 1604-E04.

Figure 53. Interior of feature 1604-E04 after excavation in 2019.

Feature 1604-E05: Solution Cavity

This solution cavity was located in the roadcut north of the westbound mainlanes of Loop 1604 to the east of Huebner Road (Figure 54 - Figure 56). This solution cavity measured 0.2 m (0.7 ft) wide by 0.2 m (0.8 ft) long by 0.9 m (3 ft) high and contained breakdown, flowstone, and exposed bedrock. An assessment performed on January 13, 2010 indicated that excavation was not warranted; however, because of the difficulty of seeing back into the feature, leaving open the potential for mesocavernous voids, subsequent visits were performed on March 25, May 13, and August 17, 2010. Fauna observed on those days included only surface beetles and isopods, and follow up excavation concluded that the void does come to a definitive end less than a meter from the entrance (Figure 54). In 2019 the earlier datasets were re-evaluated to verify the potential for karst invertebrate habitat. This feature was determined not to provide potential habitat for listed karst invertebrate species and no fauna surveys were performed (Table 2). A review of TxDOT 2019b and USFWS 2019 indicates that this feature may be removed during future construction at the Blanco Road intersection.

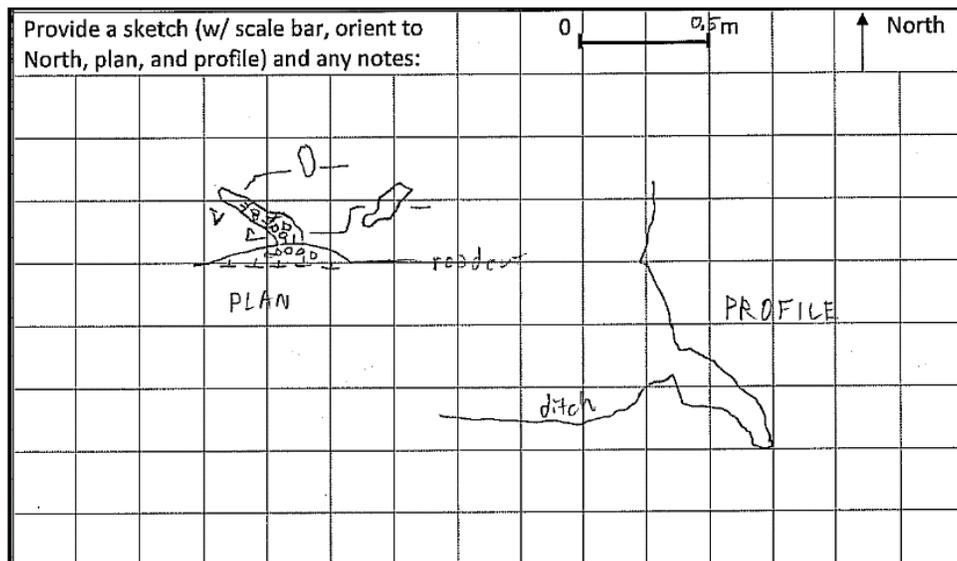

Figure 54. Field sketch of feature 1604-E05.

Figure 55. Overview of feature 1604-E05.

Figure 56. Interior of feature 1604-E05.

Feature 1604-E09 (Green Mountain Road Cave): Cave

This feature, located south of Loop 1604 and just west of Green Mountain Road, was documented on January 14, 2010 as Green Mountain Road Cave (Figure 57 - Figure 59). Green Mountain Road Cave was thought to be a partially explored historic cave with a currently known length of 22 m (72.2 ft) and depth of 15 m (49.2 ft). A collapse feature 40 m (131.2 ft) to the west may be associated with this cave. During the excavation of the cave in 2010, 102.5 person-hours were spent excavating 15.6 m³ (550.9 ft³) of material using hand tools, a jackhammer and a backhoe. The bottom of this feature had airflow coming from small spaces in the floor, indicating that continued excavation would likely lead into more passage. Excavation was terminated because collections of troglobites indicated that habitat had been reached. Fauna surveys were conducted in May and September 2010 (TxDOT 2015a).

Due to the possible presence of endangered species, a gate was installed at the cave on June 11, 2012 (Figure 60). Integrated into this gate was a concrete retaining structure designed to prevent loose material from collapsing into the cave. Fauna detected in 2010 included five troglobites, one of which is an eyeless *Cicurina* sp. spider. One author examined the spider tissue from this site, and due to an incongruence between nuclear and mitochondrial DNA concluded that the site needs more study before a species name could be assigned (Hedin et al. 2018). Another author examined only mitochondrial DNA and concluded the best match for that site is *Cicurina baronia* (in prep). Under advice from USFWS (Jenny Wilson, personal communication, 16 August 2019), in this document the species is treated as the endangered *Cicurina baronia* (Figure 61).

Presence/absence surveys conducted in July and August 2019 (Table 6) did not result in the collection of additional *Cicurina* specimens; however, they did result in the collection of a schizomid, an order of arachnids that is rare in Texas (Figure 62). Per Oscar Francke at Universidad Nacional Autónoma de México (UNAM), the collected specimen was missing the flagellum and does not have enough material for a description; however, it is likely an undescribed species in the genus *Agastochizomus*. This would make it the second troglobitic schizomid species in Texas. A summary of notable fauna is in Table 1. Four non-listed troglobites (*Brackenridgia* sp., *Chinquipellobunus* sp., protoschizomida, and *Texoreddellia* sp.), and a potential fifth troglobite, *Eidmannella* sp., were found during the 2019 surveys.

Ant	Formicidae
Fly/Gnat	Diptera

Feature 1604-F061 (Scottish Beard Cave): Cave

Scottish Beard Cave was located south of the eastbound mainlanes of Loop 1604, east of Bitters Road (Figure 63 - Figure 66). A feature evaluation was performed on August 6, 2009 and June 20, 2019. This cave was 1.8 m (5.9 ft) wide at the entrance, was 5.5 m (18 ft) long, and 3.8 m (12.5 ft) deep. Previous records from TSS indicate this feature may also have the name "I Think It's a Cave". Excavation was conducted on October 6-8 and 14, 2009, utilizing 51.5 person hours of effort and removing approximately 5.1 m³ (180.1 ft³) of material. The sloping entrance crawlway was enlarged, giving access to a 2.6 m (8.5 ft) climb-down. This climb-down lands on a gravel and rubble floor that goes up and over a rise to the north for 2 m (6.6 ft), where small voids continue. Biological surveys were conducted in October and November 2009, when four non-listed troglobite species were found.

In July 2019, rocks which had been placed over the entrance were removed. Presence/absence surveys were conducted in June and July 2019 (Table 8); notable fauna is summarized in Table 1. Three non-listed troglobites (*Brackenridgia* sp., *Chinquipellobunus* sp., and *Texoreddellia* sp.) were found during the 2019 surveys.

Feature 1604-F063: Solution Cavity

This feature was in the roadcut north of the westbound mainlanes of Loop 1604 west of Huebner Road. This was a solution cavity located at the bottom of the roadcut that was 1 m (3.3 ft) wide by 2.5 m (8.2 ft) long by 1 m (3.3 ft) high (Figure 67 - Figure 69). The feature contained gray soil. The void extends into the roadcut at a 315-degree trend, ending with no mesocavernous voids extending off (Figure 69). This feature was evaluated on August 6, 2009, February 2, 2010, and August 9, 2019. While the feature meets the length criteria for habitat, the presence of calcite coating nearly all the surfaces, the lack of connectivity to other voids, and the large entrance diameter combine to make this feature unsuitable. This feature was determined not to provide potential habitat for listed karst invertibrate species and no fauna surveys were performed (Table 2).

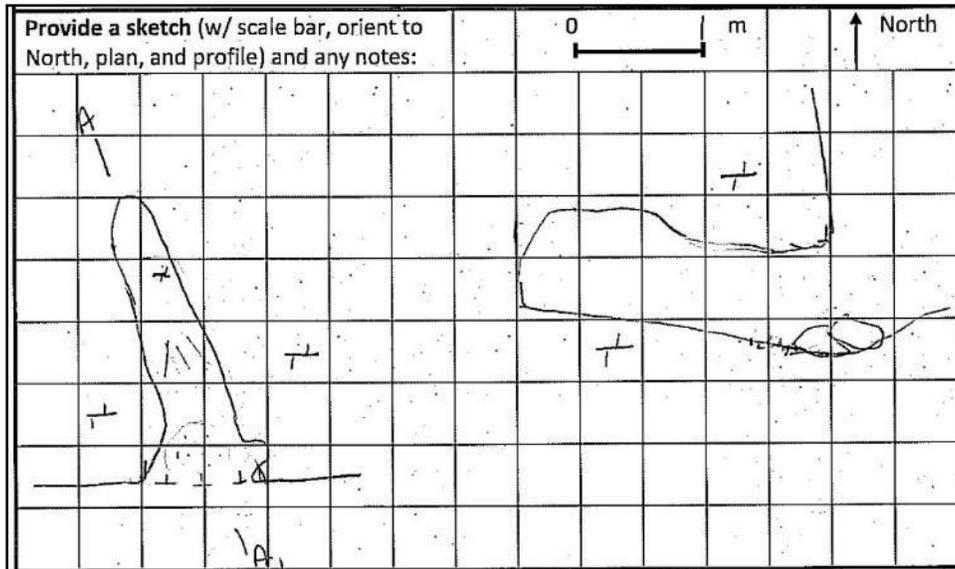

Figure 67. Field sketch of feature 1604-F063.

Figure 68. Overview of feature 1604-F063.

Figure 69. Interior of feature 1604-F063, showing no mesocavernous voids extending from the end.

Feature 1604-F064; Enlarged Fracture

This feature was in the roadcut north of the westbound mainlanes of Loop 1604 west of Huebner Road. It was evaluated on August 6, 2009, November 29, 2017, and September 25, 2019. This solution cavity was 3 m (9.8 ft) wide by 1.5 m (5 ft) long by 1.25 m (4.1 ft) tall (Figure 70 - Figure 71). It was filled loose rocks and red clay soil. Although it was slightly over 1 m (3.3 ft) in length, the large diameter of its opening and lack of mesocavernous voids make it unsuitable. This feature was determined not to provide potential habitat for listed karst invertebrate species and no fauna surveys were performed (Table 2).

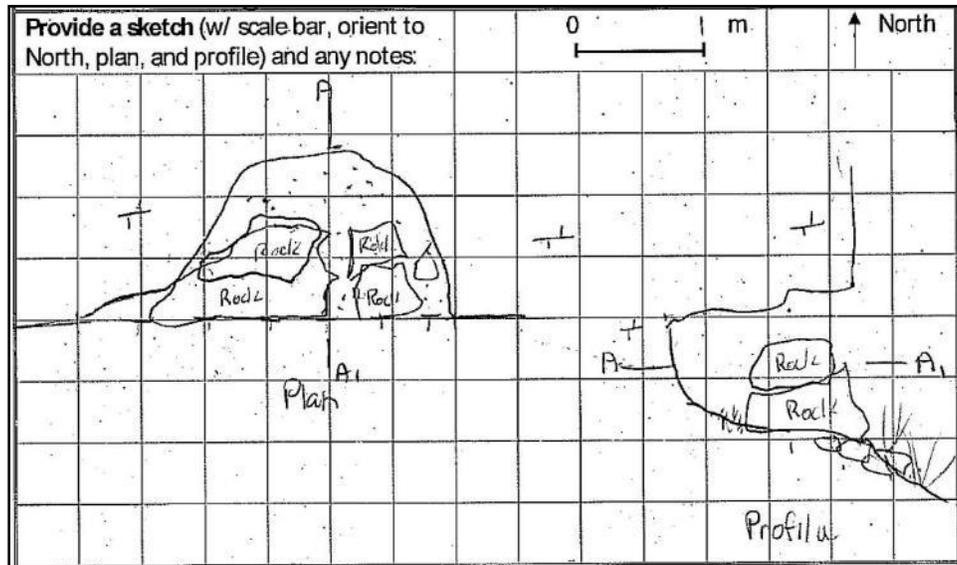

Figure 70. Field sketch of feature 1604-F064.

Figure 71. Overview of feature 1604-F064.

Figure 72. Interior of feature 1604-F064.

Feature 1604-F066; Solution-enlarged Bedding Plane

This feature was located in the roadcut north of the westbound mainlanes of Loop 1604, west of Huebner Road (Figure 73 - Figure 74). It was evaluated on August 6, 2009, November 29, 2017, and August 14, 2019. This solution-enlarged bedding plane measured 1.5 m (5 ft) wide by 0.5 m (1.6 ft) long by 0.2 m (0.6 ft) high. It narrows as it extends into the roadcut and had no mesocavernous voids extending from the footprint. This feature was determined not to provide potential habitat for listed karst invertebrate species and no fauna surveys were performed (Table 2).

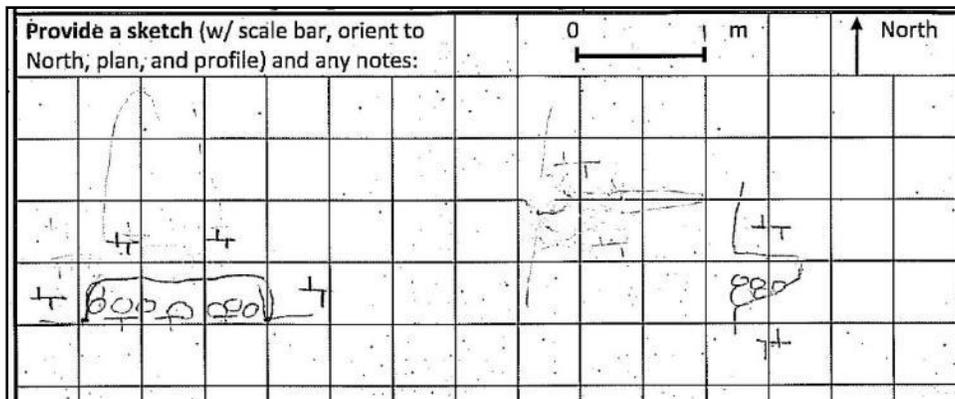

Figure 73. Field sketch of feature 1604-F066.

Figure 74. Overview of feature 1604-F066.

Feature 1604-F069: Solution-enlarged Bedding Plane

This feature was located in the roadcut north of the westbound mainlanes of Loop 1604 west of Huebner Road (Figure 75 - Figure 77). It was evaluated on August 6, 2009, February 2, 2010, and August 9, 2019. This solution-enlarged bedding plane measured 3.5 m (11.4 ft) wide by 2.5 m (8.2 ft) long by 0.75 m (2.5 ft) high. This feature was infilled with loose rocks. It narrows as it extends into the roadcut and continues as a very low bedding plane. While the feature meets the length criteria for habitat, the large entrance diameter makes this feature overly exposed to the surface to provide habitat for cave species. This feature was determined not to provide potential habitat for listed karst invertebrate species and no fauna surveys were performed (Table 2).

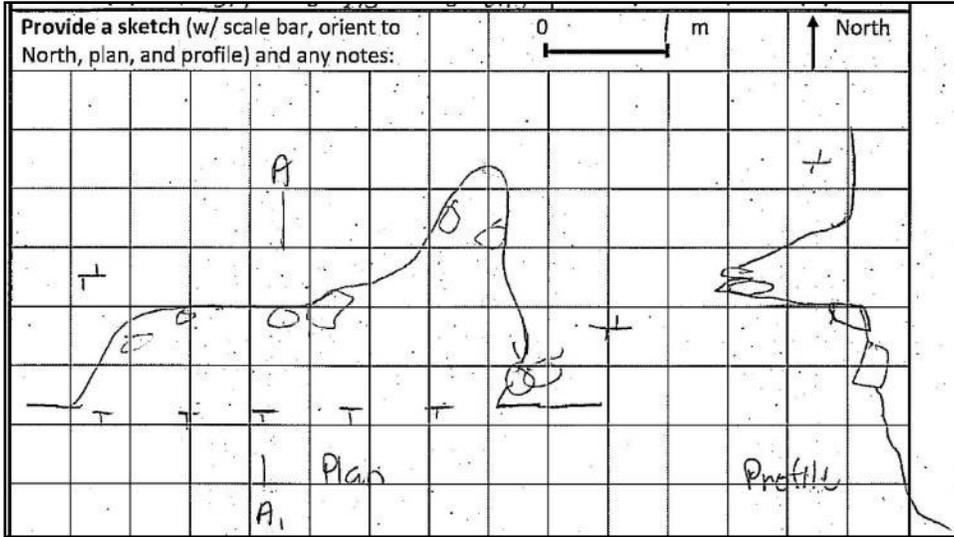

Figure 75. Field sketch of feature 1604-F069.

Figure 76. Overview of feature 1604-F069.

Figure 77. Interior of feature 1604-F069.

Feature 1604-F070; Zone with Solution Cavity and Solution-enlarged Fractures

This zone of features was located in the roadcut south of the eastbound mainlanes of Loop 1604 and east of Huebner Road (Figure 78 - Figure 81). Field evaluations were performed on August 2, 2009 and November 30, 2017, and field datasheets were re-evaluated in 2019 to verify the potential for karst invertebrate habitat. The feature had a solution-enlarged fracture located at the base of the roadcut that was 0.5 m (1.6 ft) wide by 1.0 m (3.3 ft) high and 0.7 m (2.3 ft) long. In addition to the solution-enlarged fracture, a solution-enlarged bedding plane and bisected solution cavity are also present immediately above the solution-enlarged fracture. The zone containing all three features measured 15.2 m (50 ft) wide by 0.8 m (2.5 ft) long by 4.3 m (14 ft) high. These features are infilled with loose soils, rocks, bedrock, and vegetation. Flowstone was present in the solution-enlarged fracture. There was no airflow, no mesocavernous voids, and the feature was not humanly enterable. This feature was determined not to provide potential habitat for listed karst invertebrate species and no fauna surveys were performed (Table 2). A review of TxDOT 2019b and USFWS 2019 indicates that this feature may be removed during future construction at the Blanco Road intersection.

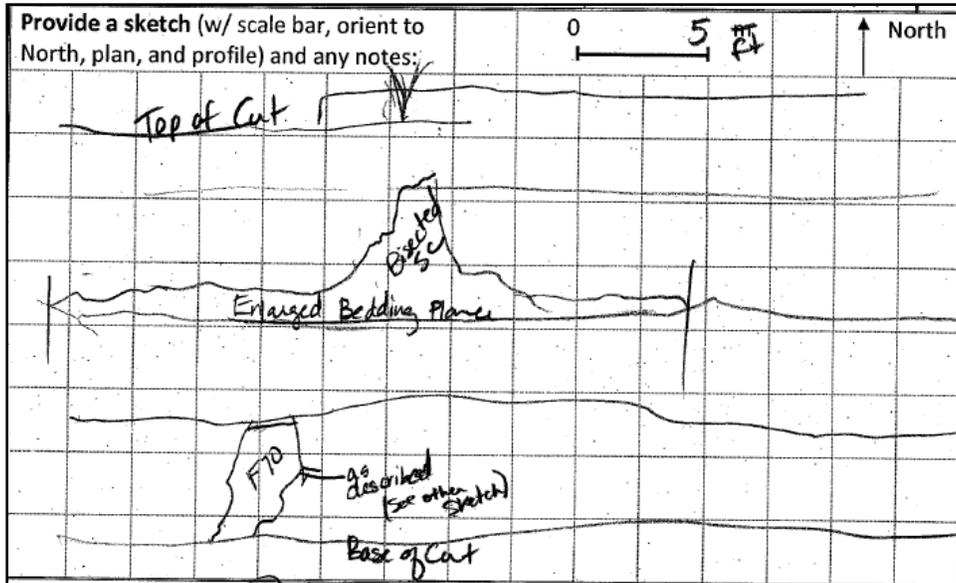

Figure 78. 2017 field sketch of feature 1604-F070.

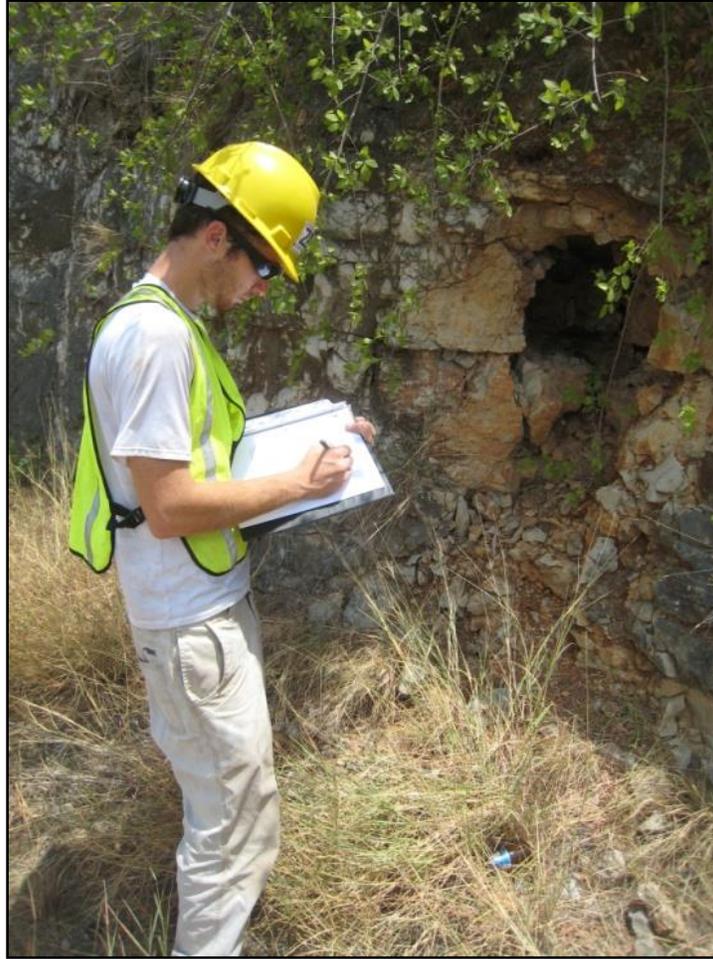

Figure 80. Solution cavity at feature 1604-F070.

Figure 81. Interior of solution cavity at feature 1604-F70.

Feature 1604-F071: Solution-enlarged Bedding Plane

This feature was located in the roadcut north of the westbound mainlanes of Loop 1604 east of Huebner Road situated at the base of a roadcut (Figure 82 - Figure 84). It was evaluated on August 2, 2009 and August 14, 2019. This solution-enlarged bedding plane was 2.5 m (8.2 ft) wide by 1.0 m (3.3 ft) long by 0.3 m (1.0 ft) high. This feature contained loose, modern soils likely introduced by landscaping activities, coarse cobbles, flowstone, and bedrock. This feature was determined not to provide potential habitat for listed karst invertebrate species and no fauna surveys were performed (Table 2).

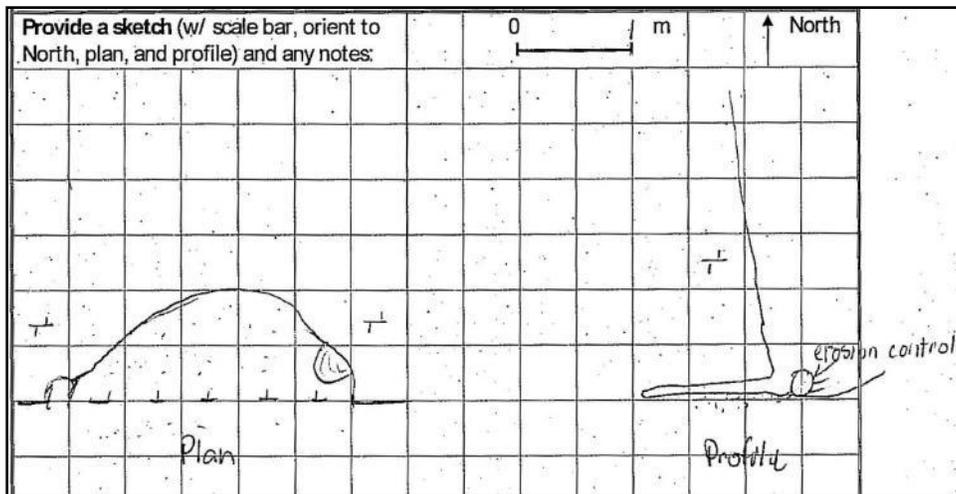

Figure 82. Field sketch of feature 1604-F071.

Figure 83. Overview of feature 1604-F071.

Figure 84. Interior of feature 1604-F071.

Feature 1604-F072 (Air Filter Cave): Cave

Air Filter Cave was located in the roadcut south of the eastbound mainlanes of Loop 1604 east of Huebner Road (Figure 85 - Figure 87). This cave had previously been referred to as 1604 Cave, F15H, and 1604-F26. It was evaluated on August 2, 2009 and on March 22, 2019. Air Filter Cave had an entrance that was 12 m (39 ft) wide, extends 10 m (33 ft) into the roadcut, and had maximum height of 2 m (6.6 ft) at its entrance. The cave was developed on a low bedding plane passage that was barely enterable prior to excavation (Figure 87). The floor was partially covered with flowstone and there are numerous stalactites. Excavation was conducted in September and October 2009, utilizing 29 person hours of effort and removing 1.4 m³ (15 ft³) of material. Excavation primarily involved chiseling flowstone from the floor to allow access to the back of the cave. The back of the cave drops down slightly but there are no voids extending from it. Presence/absence surveys were conducted in October 2009, during which no karst invertebrate species were found. The cave was re-evaluated on March 22, 2019 as part of a study for planned improvements at Blanco Road (TxDOT 2019a). Although this site meets two of the size criteria for potential habitat (extends greater than 1 m [3.3 ft] and was humanly enterable) (Table 2), it had been subject to desiccation and daylight since the original construction of Loop 1604 in the 1980's due to the great width of the entrance. Consequently, it was not considered habitat for karst invertebrates and was not surveyed in 2019 (Table 2). A review of TxDOT 2019b and USFWS 2019 indicates that this feature may be removed during future construction at the Blanco Road intersection.

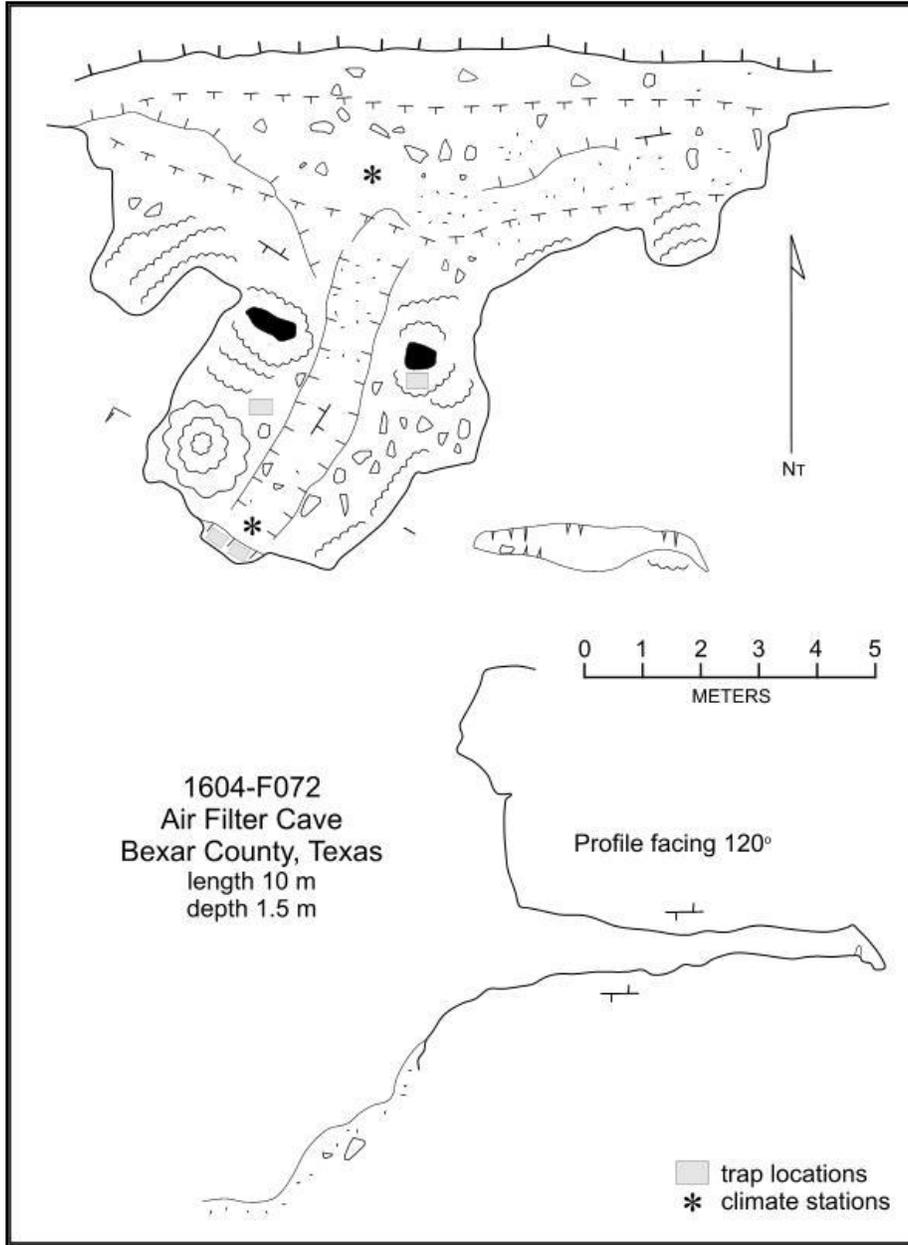

Figure 85. Map of feature 1604-F072 (Air Filter Cave).

Figure 86. Overview of feature 1604-F072 (Air Filter Cave).

Figure 87. Interior of feature 1604-F072 (Air Filter Cave).

Feature 1604-F073 (Leopard Cave): Cave

This cave was located at the base of the roadcut south of the eastbound mainlanes of Loop 1604, east of Huebner Road (Figure 88 - Figure 90). It was evaluated on August 2, 2009 and on March 22, 2019 (TxDOT 2015a, 2019a). It was formed on a solution-enlarged bedding plane at the base of the roadcut, and appears to be developed along a fracture trending 90 degrees with a dip of 35 degrees south. Infill consists of coarse rocks, calcite, and bedrock. The feature was 2.4 m wide (7.9 ft) wide at the entrance by 3.5 m (11.5 ft) long by 1.5 m (5 ft) high at the entrance. Excavation to remove a large block at the entrance occurred in October 2009, utilizing 39.5 person hours of labor, resulting in the removal of 3 m² (33 ft³) of material from the feature. This feature was infilled with speleothems, bedrock, and loose rocks, and it had mesocavernous voids extending off the back of it (Figure 90). This feature meets many of the criteria for potential habitat, including void size greater than or equal to 1 m, similarity to nearby caves and being humanly enterable (Table 2), and qualifies as potential karst invertebrate habitat. Presence/absence surveys conducted in October and November 2009 detected cave crickets, including the more rarely seen *Ceuthophilus cunicularis*, but no troglobites. Presence/absence surveys were conducted in March and April 2019 (Table 10) (TxDOT 2019a); notable fauna is summarized in Table 1. A review of TxDOT 2019b and USFWS 2019 indicates that this feature may be removed during future construction at the Blanco Road intersection.

Feature 1604-F074: Solution Cavity

This feature was located in the roadcut south of the eastbound mainlanes of Loop 1604, east of Huebner Road (Figure 91 - Figure 93). It was evaluated on August 2, 2009, November 30, 2017 (TxDOT 2015a, TxDOT 2018a), and August 12, 2019. This solution cavity measured 0.8 m (2.6 ft) wide by 2.5 m (8.2 ft) long and was 0.8 m (2.6 ft) high. It contained dry flowstone and exposed bedrock and was infilled with loose rocks (Figure 93). About 1.5 m (5 ft) into the feature, it splits into two mesocavernous voids. Due to its length, presence of mesocavernous voids, and similarity to nearby caves, it was considered potential karst invertebrate habitat (Table 2). Presence/absence surveys were conducted in August and September 2019 (Table 11); however, no troglobites were found (Table 1). A review of TxDOT 2019b and USFWS 2019 indicates that this feature may be removed during future construction at the Blanco Road intersection.

Feature 1604-F076: Solution-enlarged Fracture

This feature was located at the base of a roadcut north of the westbound mainlanes of Loop 1604, west of Blanco Road (Figure 94 - Figure 96). It was evaluated on August 2, 2009 and July 3, 2019. The feature was a solution-enlarged fracture that measured 0.2 m (0.7 ft) wide, 0.5 m (1.6 ft) long, by 0.15 m (0.5 ft) high. This feature contained bedrock and was infilled with loose rocks, organic soil, and leaf litter. This feature was determined not to provide potential habitat for listed karst invertebrate species and no fauna surveys were performed (Table 2). A review of TxDOT 2019b and USFWS 2019 indicates that this feature may be removed during future construction at the Blanco Road intersection.

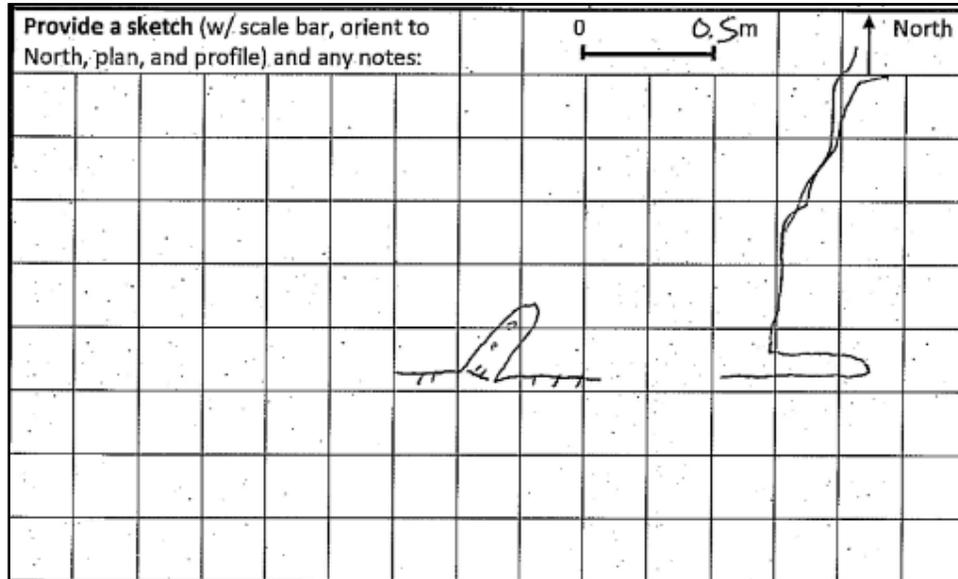

Figure 94. Field sketch of feature 1604-F076.

Figure 95. Entrance of feature 1604-F076.

Figure 96. Interior of feature 1604-F076.

Feature 1604-F077 (Hubcap Cave); Cave

Hubcap Cave was located at grade in the roadcut of the westbound mainlanes of Loop 1604 between Blanco Road and Huebner Road (Figure 97). When evaluated on August 2, 2009, it was apparent that excavation had taken place previously at the site. These excavation efforts ceased with narrow extensions continuing beyond line of sight. Further excavation took place on October 7 and 12, 2009, utilizing 30 person hours of effort. Three m³ (105.9 ft³) of material were removed from the cave. The entrance opened into a sloping room 3 m (9.8 ft) wide and 3.5 m (11.5 ft) long. Beyond this was a constricted drain that dropped another 2 m (6.6 ft) to two small drain holes. Biological surveys were conducted on October 15 and 22, 2009, and November 3, 2009. A single troglobite was found (*Brackenridgia cavernarum*); therefore, this feature was karst invertebrate habitat. No listed species were found during the 2009 surveys (TxDOT 2015a).

Feature 1604-F077 was re-evaluated on March 22, 2019 (Figure 98 - Figure 100) (TxDOT 2019a). It was 1.9 m (6.2 ft) wide at the entrance, was 5 m (16.4 ft) long, and 4 m (13 ft) deep. It contained leaf-litter, soil and rocks. Hand excavation was performed to remove rocks previously placed in the entrance; approximately 1.5 m³ (16 ft³) of rocks and boulders were removed. This cave met many of the criteria for potential habitat, including the presence of leaf-litter and modern soils, void size greater than or equal to 1 m, similarity to nearby caves, and being humanly enterable (Table 2). Speleothems and moisture were present within this feature. Debris found in the rear of the cave indicates that water was entering the feature from the bar ditch (Figure 100). Presence/absence surveys were conducted in March and April 2019 (Table 13)(TxDOT 2019a); notable fauna is summarized in Table 1. Troglotic organisms encountered during the 2019 survey included woodlice (*Brackenridgia* sp.). A review of TxDOT 2019b and USFWS 2019 indicates that this feature may be removed during future construction at the Blanco Road intersection.

Feature 1604-F078; Solution Cavity

This feature was located in a roadcut south of the eastbound mainlanes of Loop 1604, west of Blanco Road (Figure 101 - Figure 104). It was evaluated on August 2, 2009 and July 3, 2019. This feature was formed at the base of the road cut, and slopes downward to a rubble fill. It was a solution cavity that measured 1.2 m (3.9 ft) wide by 0.7 m (2.4 ft) long and 1.5 m (4.9 ft) deep. Excavation was conducted on October 2 and 5, 2009, expending 14 person hours of effort and removing 3 m³ (105.9 ft³) of material. This excavation effort enlarged the feature length to 1.5 m (4.9 ft) and vertical extent to 2.2 m (7.2 ft). At the point where excavation stopped, there were no open voids continuing into bedrock, only some small tubes and vugs plugged with red clay. This site was not considered karst invertebrate habitat at that time. When re-assessed in 2019, it had been filled in with rocks. No airflow was noted coming from the rock fill. This feature was determined not to provide potential habitat for listed karst invertebrate species and no fauna surveys were performed (Table 2). A review of TxDOT 2019b and USFWS 2019 indicates that this feature may be removed during future construction at the Blanco Road intersection.

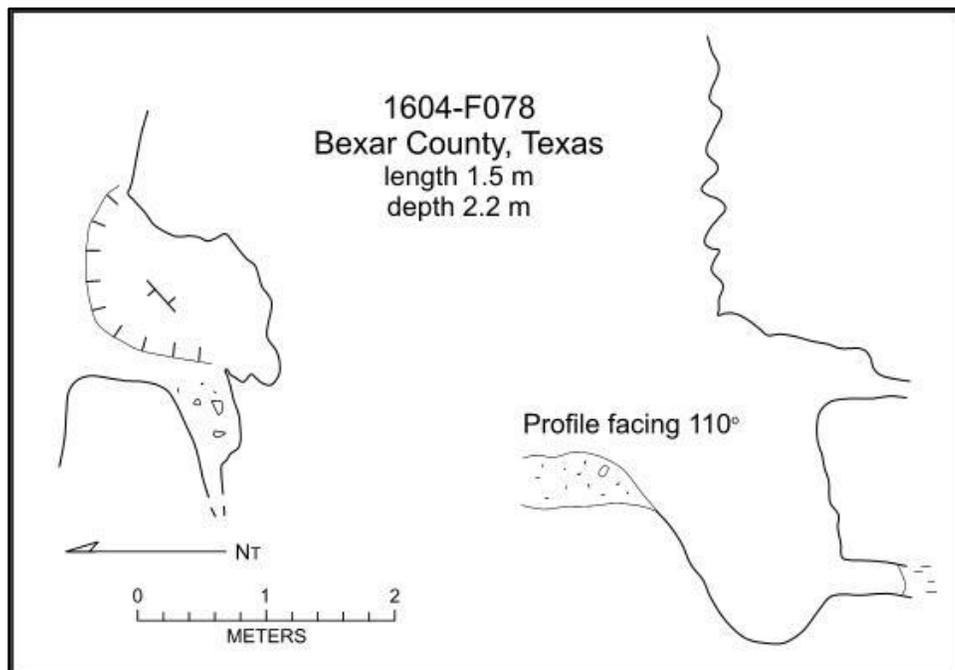

Figure 101. Map of feature 1604-F078, after excavation in 2009.

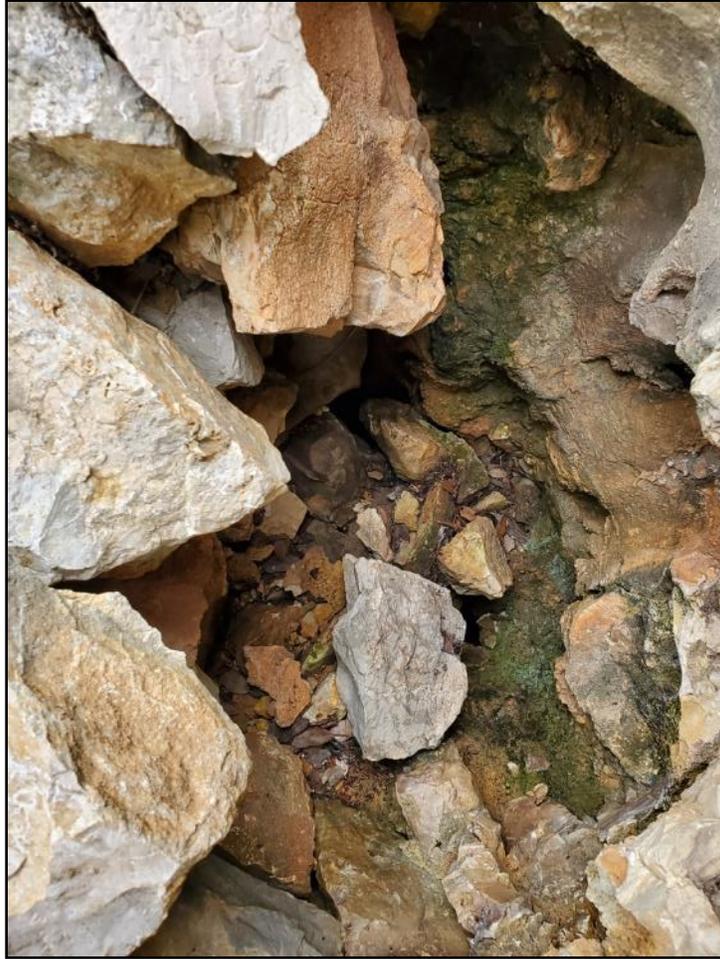

Figure 104. Interior of feature 1604-F078.

[Feature 1604-F079; Solution-enlarged bedding plane](#)

This feature was located in the roadcut north of the westbound mainlanes of Loop 1604, west of Blanco Road (Figure 105 - Figure 107). It was evaluated on August 2, 2009 and July 3, 2019. The feature was a solution-enlarged bedding plane that measured 1.2 m (3.9 ft) wide by 0.7 m (2.4 ft) long and 1.5 m (4.9 ft) deep, situated about 0.8 m (2.6 ft) above the bottom of the road cut. This feature was determined not to provide potential habitat for listed karst invertebrate species and no fauna surveys were performed (Table 2). A review of TxDOT 2019b and USFWS 2019 indicates that this feature may be removed during future construction at the Blanco Road intersection.

Figure 107. Interior of feature 1604-F079.

Feature 1604-F083; Solution Cavity

This feature was located in a roadcut south of the eastbound mainlanes of Loop 1604, west of Blanco Road (Figure 108 - Figure 110). It was evaluated on August 2, 2009 and July 3, 2019. The feature was a solution cavity that measured 0.5 m (1.6 ft) wide by 0.5 m (1.6 ft) long and 0.7 m (2.3 ft) high. This feature was filled with loose rocks. This feature was not humanly enterable, had no noticeable airflow and no mesocavernous voids. This feature was determined not to provide potential habitat for listed karst invertebrate species and no fauna surveys were performed (Table 2). A review of TxDOT 2019b and USFWS 2019 indicates that this feature may be removed during future construction at the Blanco Road intersection.

Figure 109. Entrance of feature 1604-F083.

Figure 110. Interior of feature 1604-F083.

Feature 1604-F084; Enlarged Bedding Plane

This feature was located approximately 1 m (3.3 ft) above grade in the mainlane roadcut of eastbound Loop 1604, just west of Blanco Road (Figure 111 - Figure 113). It was evaluated on August 2, 2009 and March 22, 2019 (TxDOT 2015a, TxDOT 2019a). It was an enlarged bedding plane that was 1.5 m (4.9 ft) wide, 3.0 m (9.8 ft) long, and 0.3 m (1 ft) high. It contained bedrock, rocks and soil. It was determined that this feature met criteria for potential habitat, including void size greater than 1 m (3.3 ft), mesocavernous voids, and similarity to nearby caves (Table 2). Presence/absence surveys were conducted in March and April 2019 (Table 14); however, no troglobites were found (Table 1)(TxDOT 2019a). A review of TxDOT 2019b and USFWS 2019 indicates that this feature may be removed during future construction at the Blanco Road intersection.

Feature 1604-F085; Solution-enlarged Bedding Plane

This feature was located in a roadcut south of the eastbound mainlanes of Loop 1604, west of Blanco Road (Figure 114 - Figure 116). It was evaluated on August 2, 2009 and July 3, 2019. The feature was a solution-enlarged bedding plane that measured 0.7 m (2.3 ft) wide by 1.1 m (3.6 ft) long and 1.2 m (3.9 ft) high. It was not humanly enterable and there was no airflow. This feature contained bedrock, organic soil, and loose rocks. While the feature meets the length criteria for potential habitat, the large height of the entrance cavity makes the interior unsuitable due to surface climate effects. This feature was determined not to provide potential habitat for listed karst invertebrate species and no fauna surveys were performed (Table 2). A review of TxDOT 2019b and USFWS 2019 indicates that this feature may be removed during future construction at the Blanco Road intersection.

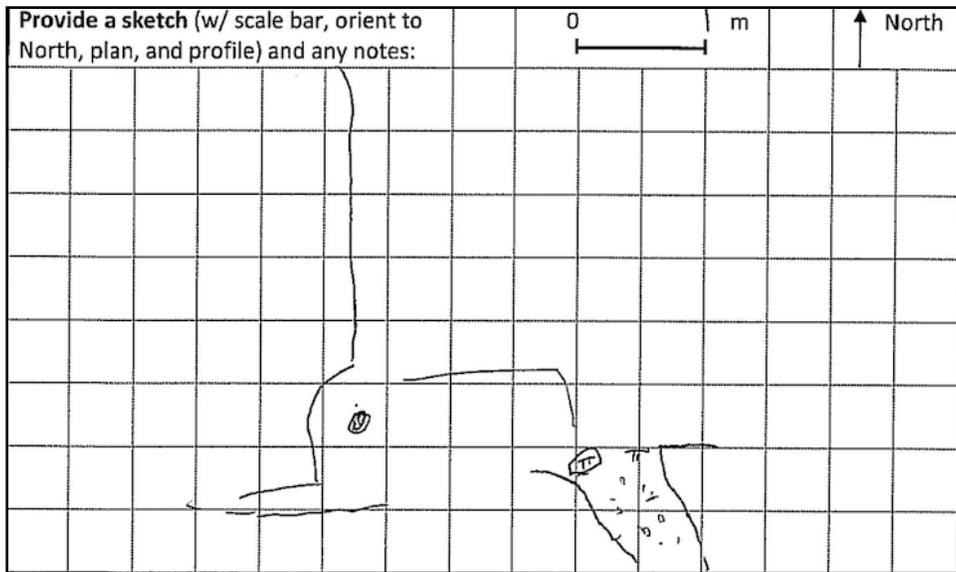

Figure 114. Field sketch of feature 1604-F085.

Figure 115. Overview of feature 1604-F085.

Figure 116. Interior of feature 1604-F085.

Feature 1604-F101 (Tally Ho Cave): Cave

This cave was found on 15 July 2009 on the south side of Loop 1604, just east of US 281 (Figure 117 - Figure 118). It was partially mined away for the 2012 construction of the 281/1604 interchange, with the remainder grouted shut as part of the Water Pollution Abatement Plan (WPAP) for that project (Figure 119). This feature was comprised of four holes stacked one above the other in the road cut, developed on an enlarged fracture. Initially, the lowest entrance, near ground level, was 2.2 m (7.2 ft) wide and extended 1.6 m (5.2 ft) into the face of the road cut. Total vertical extent of this feature was 5 m (16.4 ft). The lower part of the feature was excavated using 15.8 person hours of effort, with 7.5 m³ (80.7 ft³) of material removed from the feature, making it 5 m (16.4 ft) long and 2 m (6.6 ft) deep. After an initial drop-off at the entrance, there was a step-up at a narrow spot that then gives access to a room measuring 1.5 (4.9 ft) by 2 m (6.6 ft), with some small holes extending up into the ceiling. Biological surveys were conducted on October 6, 16, and 23, 2009 (TxDOT 2015a). An eyeless spider was collected in a glue trap that was identified as *Cicurina platypus*. This is a non-listed species known very few other localities. Since this feature was plugged with grout (Figure 120), it was not assessed for karst species in 2019 (Table 1).

Figure 120. Feature 1604-F101 (Tally Ho Cave) in 2019.

[Feature 1604-FZ3: Enlarged Bedding Plane](#)

This feature was located approximately 0.5 m above grade in the roadcut of eastbound 1604 between Blanco Road and Huebner Road (Figure 121 - Figure 123). It was evaluated on January 12, 2010 and March 22, 2019 (TxDOT 2015a, TxDOT 2019a). Feature 1604-FZ3 was an enlarged bedding plane that measured 0.3 m (1 ft) wide by 3 m (9.8 ft) long by 0.3 m (1 ft) high. It contained bedrock and rocks. It was determined that this feature met criteria for potential habitat, including void length greater than 1 m (3.3 ft), presence of mesocavernous voids, and similarity to nearby caves (Table 2). Fauna surveys were conducted on March 11 and 24, and April 5, 2010, during which no karst invertebrates were found. Evaluations in 2019 also indicated potential habitat, and those presence/absence surveys were conducted in March and April 2019 (Table 15); however, no troglobites were found (Table 1). A review of TxDOT 2019b and USFWS 2019 indicates that this feature may be removed during future construction at the Blanco Road intersection.

Gnat	

Feature 1604-FZ4; Solution Cavity

This feature was located in a roadcut south of the eastbound mainlanes of Loop 1604, west of Blanco Road (Figure 124 - Figure 126). It was evaluated on August 2, 2009 and July 3, 2019. The feature was a solution cavity 0.45 m (1.5 ft) wide by 1.1 m (3.6 ft) long, and 0.25 m (0.8 ft) high. There was no noticeable airflow and the feature was not humanly enterable. Mesocavernous voids were observed. This feature contained fine organic soil and leaf litter. In 2009, it did not meet the criteria for karst invertebrate habitat; however, the current criteria are more slightly more stringent (USFWS 2015a) and the 2019 set of measurements put this feature over that threshold. Due to it having mesocavernous voids and a length greater than 1 m (3.3 ft), it was considered potential karst invertebrate habitat (Table 2). Presence/absence surveys were conducted in August and September 2019 (Table 16); however, no troglobites were found (Table 1). A review of TxDOT 2019b and USFWS 2019 indicates that this feature may be removed during future construction at the Blanco Road intersection.

Feature 1604-FZ6: Zone with Solution-enlarged Fracture and Solution Cavity

This feature was a zone containing two features in the roadcut north of the westbound mainlanes of Loop 1604 east of Huebner Road (Figure 127 - Figure 128). It was evaluated on August 2, 2009 and November 29, 2017 (TxDOT 2015a and TxDOT 2018a). The largest feature in the zone was a solution-enlarged fracture located 0.5 m (1.6 ft) above the base of the roadcut. It was 0.6 m (2 ft) wide by 0.97 m (3.2 ft) long by 0.5 m (1.8 ft) high (Figure 129). This feature contained loose rocks, fine sediment, and bedrock. A smaller solution cavity was also present at the base of the cut that was 0.2 m (0.6 ft) in diameter and extends 0.2 m (0.8 ft) into the roadcut (Figure 130). The features both trend at approximately 320 degrees into the roadcut and contain mesocavernous voids that extend into the roadcut along that trend. This feature was determined not to provide potential habitat for listed karst invertebrate species and no fauna surveys were performed (Table 2).

Figure 129. The larger solution-enlarged fracture of feature 1604-FZ6.

Figure 130. The smaller solution cavity of feature 1604-FZ6.

Feature 1604-FZ7: Solution Cavity

This feature was located in the roadcut north of the westbound mainlanes of Loop 1604, west of Huebner Road (Figure 131 - Figure 134). It was evaluated on August 6, 2009 (TxDOT 2015a), November 29, 2017 (TxDOT 2018a), and August 19, 2019. It was a solution cavity that was 0.8 m (2.6 ft) wide by 1 m (3.3 ft) by 1 m (3.3 ft) high when originally examined in 2009. No voids could be seen extending from it; however, excavation on October 7, 2009 to remove loose rocks resulted in the removal of 1.2 m³ (43 ft³) of material, which appeared to be road base. The feature was excavated to a total width of 2.5 m (8 ft) by 3.5 m (11.5 ft) long by 2.6 m (8.5 ft) deep, where it ended in a mesocavernous drain. It was considered to be karst invertebrate habitat, and presence/absence surveys were conducted in October and November 2009, when a non-listed troglobitic species was found (*Brackenridgia* sp.). Presence/absence surveys were conducted in July 2019 (Table 18); notable fauna are summarized in Table 1. Troglobitic fauna encountered in 2019 included *Cicurina platypus/bullis* (Figure 135) whose identity was determined using mtDNA (Appendix C) and *Brackenridgia* sp.

Feature 1604-FZ8: Solution-enlarged Bedding Plane

This feature was located in the roadcut north of the westbound mainlanes of Loop 1604, east of Bitters Road (Figure 136 - Figure 137). It was evaluated on August 6, 2009 (TxDOT 2015a) and November 28, 2017 (TxDOT 2018a). It was an enlarged bedding plane situated 0.5 m (1.6 ft) above the base of the roadcut. It was 3 m (10 ft) wide by 1.6 m (5.3 ft) long by 0.3 m (1 ft) high. No mesocavernous voids were observed. The feature was filled with loose cobbles, fine sediment and bedrock (Figure 138). Although this feature met the habitat criteria of being greater than 1 m in length, it had no mesocavernous voids and a very wide entrance which made the feature desiccated. This feature was determined not to provide potential habitat for listed karst invertebrate species and no fauna surveys were performed (Table 2).

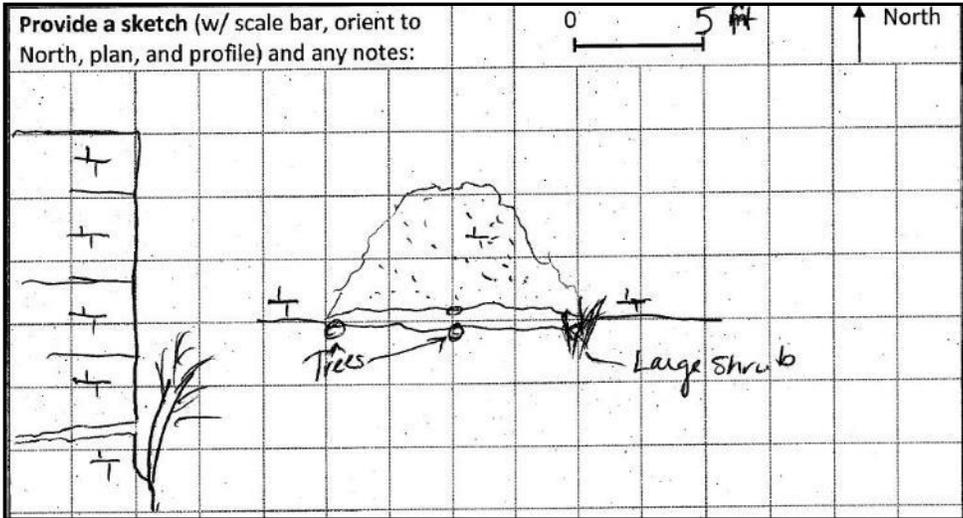

Figure 136. Field sketch of feature 1604-FZ8.

Figure 137. Overview of feature 1604-FZ8.

Figure 138. Interior of feature 1604-FZ8.

Feature 1604-K41; Solution Cavity

This feature was located in a roadcut north of the westbound mainlanes of Loop 1604, east of Gold Canyon Road (Figure 139 - Figure 141). A feature evaluation was performed on December 8, 2009 and June 17, 2019. This solution cavity measured 0.6 m (2 ft) wide by 0.3 m (1.1 ft) high and 0.4 m (1.3 ft) deep. Excavation performed on August 19, 2010 detected no mesocavernous voids. This feature was determined not to provide potential habitat for listed karst invertebrate species and no fauna surveys were performed (Table 2).

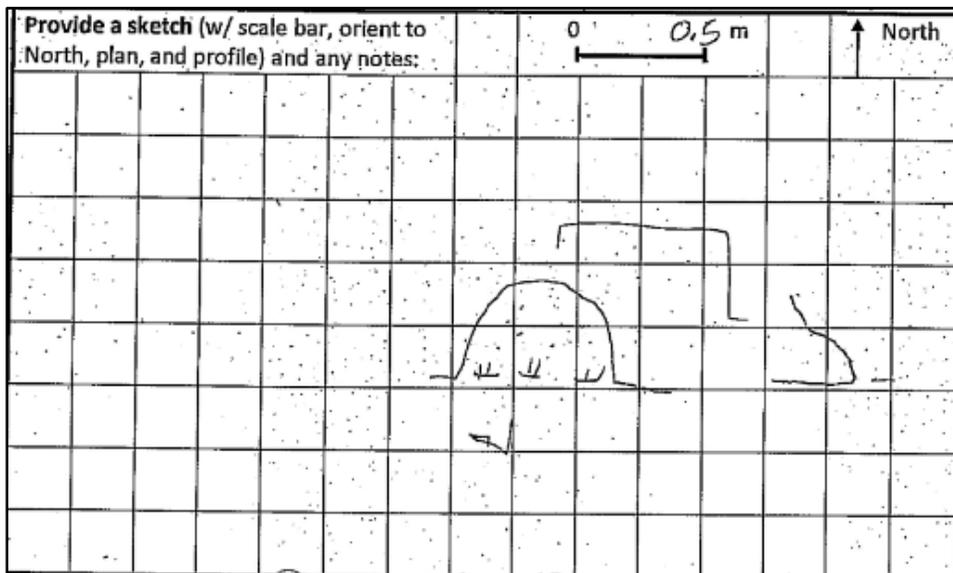

Figure 139. Field sketch of feature 1604-K41.

Figure 140. Overview of feature 1604-K41.

Figure 141. Close-up of feature 1604-K41.

Feature 1604-L02: Solution-enlarged Bedding Plane

This feature was located in a roadcut north of the westbound mainlanes of Loop 1604 and west of Bitters Road (Figure 142 - Figure 144). An evaluation was performed on December 9, 2009 and June 18, 2019. The feature was a solution-enlarged bedding plane that measured 2.0 m (6.6 ft) wide by 0.2 m (0.7 ft) long and was 0.06 m (0.2 ft) high. There was no noticeable airflow and the feature was not humanly enterable. This feature contained organic soil and leaf litter. On August 19, 2010, approximately 0.6 person hours were spent excavating 20 L (0.02 m³, 0.71 ft³) of material until encountering a zone of small interconnecting voids extending downward along a small fracture. This feature was determined not to provide potential habitat for listed karst invertebrate species and no fauna surveys were performed (Table 2).

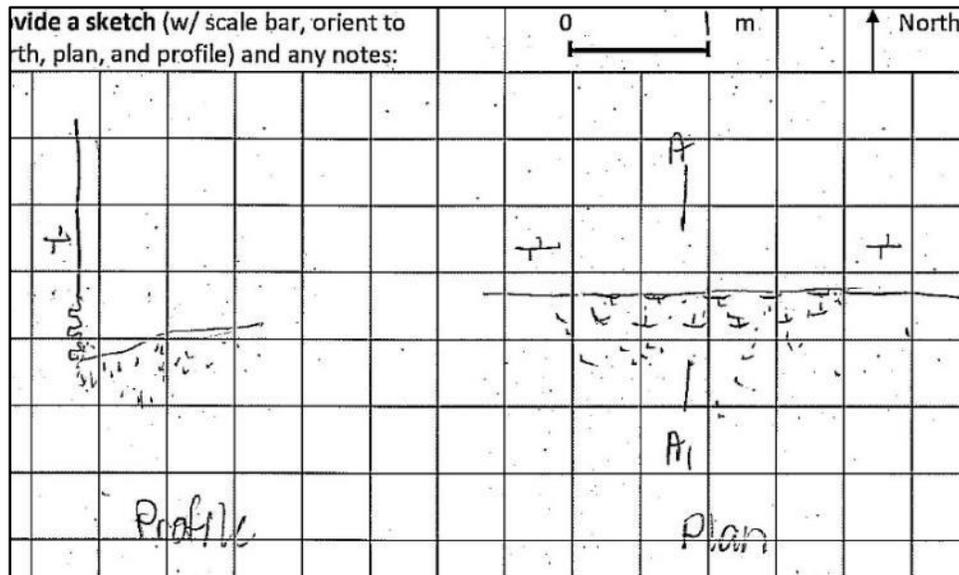

Figure 142. Field sketch of feature 1604-L02.

Figure 143. Overview of feature 1604-L02.

Figure 144. Close-up of feature 1604-L02.

Feature 1604-L11: Solution-enlarged Bedding Plane

This feature was located in the roadcut north of the westbound mainlanes of Loop 1604, west of Bitters Road (Figure 145 - Figure 147). It was assessed on December 9, 2009 (TxDOT 2015a) and November 28, 2017 (TxDOT 2018a), then these datasets were examined in 2019 to verify whether the feature met current USFWS habitat criteria. This solution-enlarged bedding plane measured 2.7 m (9 ft) wide by 0.8 m (2.5 ft) long and was 0.9 m (3 ft) high. The feature contained exposed bedrock, flowstone, and coarse breakdown. This feature was determined not to provide potential habitat for listed karst invertebrate species and no fauna surveys were performed (Table 2).

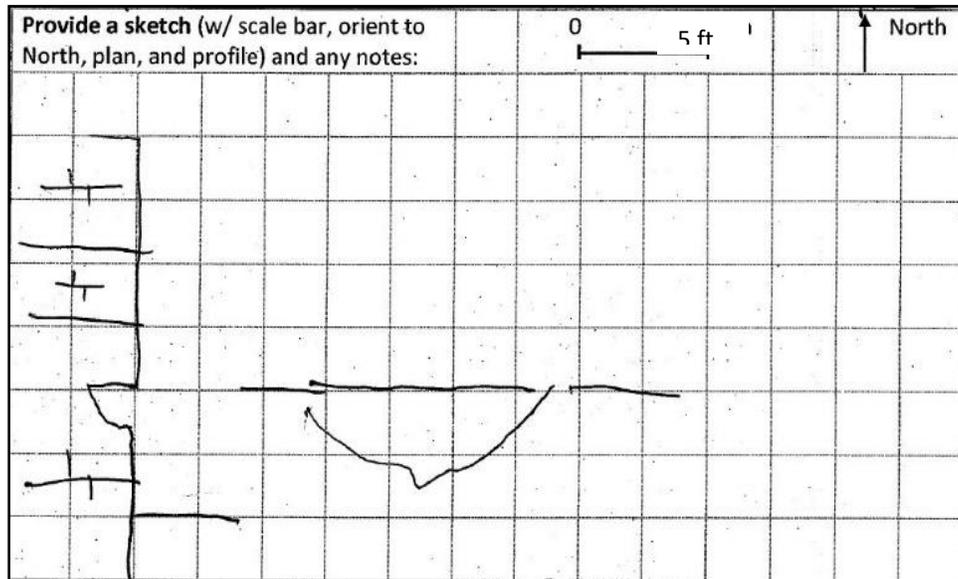

Figure 145. Field sketch of feature 1604-L11.

Figure 146. Overview of feature 1604-L11.

Figure 147. Interior of feature 1604-L11.

Feature 1604-L12: Solution-enlarged Bedding Plane

This solution-enlarged bedding plane was located in the roadcut north of the westbound mainlanes of Loop 1604 west of Bitters Road (Figure 148 - Figure 151). It was evaluated on August 17, 2009 and August 5, 2019. It was initially 0.9 m (3.0 ft) wide by 1.2 m (4 ft) long and 0.5 m (1.5 ft) high. In August 2010, 0.6 person hours were spent removing 0.7 ft³ of material using hand tools (Figure 149). The feature contained exposed bedrock, modern soils and breakdown, and roadside debris such as tire fragments that appear to have washed into the void. A distinct terminus was reached 1.7 m (5.6 ft) from the entrance, with a mesocavernous void leading off from the ceiling (Figure 150). The feature was too small to be enterable. It was re-evaluated on August 5, 2019 and measured 2.0 m (6.6 ft) wide, 1.4 m (4.6 ft) long, and 0.2 m (0.7 ft) tall at that time. An erosion control log had been placed in front of it (Figure 151). It met requirements for potential habitat due to a length over 1 m (3.3 ft) with continuing mesocavernous voids (Table 2). Presence/absence surveys were conducted in August and September 2019 (Table 20); however, no troglobites were found (Table 1).

Feature 1604-L13 and 13a: Solution Cavities

These features were located in the roadcut north of the westbound mainlanes of Loop 1604, immediately west of Bitters Road (Figure 152 - Figure 156). They were evaluated on December 9, 2009 and August 5, 2019. These are two solution cavities situated one on top of the other (Figure 153). Feature 1604-L13 measured 0.08 m (ft) wide by 1.12 m (ft) long by 0.1 m (ft) high while feature 1604-L13a measured 0.2 m (0.7 ft) wide by 0.8 m (2.6 ft) long by 0.2 m (0.5 ft) high. The lower feature 1604-L13 contained silt, pebbles, and exposed bedrock and had a very small void leading out of sight at the back (Figure 155). The upper feature 1604-L13a contained rocks and red clay, and had no voids extending off (Figure 156). Features 1604-L13 and 13a were considered potential karst invertebrate habitat due to the void size greater than or equal to 1 m (3.3 ft), and presence of mesocavernous voids (Table 2). Presence/absence surveys were conducted in August and September 2019 (Table 22); however, no troglobites were found (Table 1).

Feature 1604-L16 (12A Cave): Solution-enlarged Bedding Plane

This feature was located in the roadcut south of the eastbound mainlanes of Loop 1604 west of Bitters Road (Figure 157 - Figure 159). This feature was assessed on December 9, 2009 and August 5, 2019. It was an enlarged bedding plane measuring 0.9 m (3.0 ft) wide by 3.5 m (11.5 ft) long and 0.8 m (2.6 ft) high. This feature was in the TSS database as “12A Cave” even though it does not meet the length requirements of a cave (5 m [16.4 ft]) established by the TSS. The feature contained breakdown pebbles and rocks, flowstone and red-tan silty clay. Three karst invertebrate presence/absence surveys were performed in 2010 (Zara 2010b), and no karst invertebrate species were found during those surveys. Presence/absence surveys were conducted in August and September 2019 (Table 24, Table 25); notable fauna are summarized in Table 1. One troglobitic species, a *Cambala* sp. millipede, was detected.

Feature 1604-M14: Sinkhole

This feature was located north of the westbound mainlanes of Loop 1604, east of NW Military Highway (Figure 160 - Figure 162). It was assessed on December 2, 2009 and on 19 June 2019. The center of the feature was outside the ROW and the sinkhole footprint was bisected by the ROW fence. It was adjacent to a fire hydrant, and although it has the appearance of a natural sinkhole, it may also have been related to water line trenching for the hydrant. This feature was not excavated due to the center of the feature not being located on the ROW; however, it meets the criteria to justify excavation to fully determine whether habitat exists below grade (Table 2). It measured 0.8 m (2.5 ft) long by 0.2 m (0.66 ft) wide and 0.04 m (0.13 ft) deep. This feature contained loose soil and vegetation. Surveyors did not have right of entry; therefore, no habitat determination could be made for this feature, and no fauna surveys were performed.

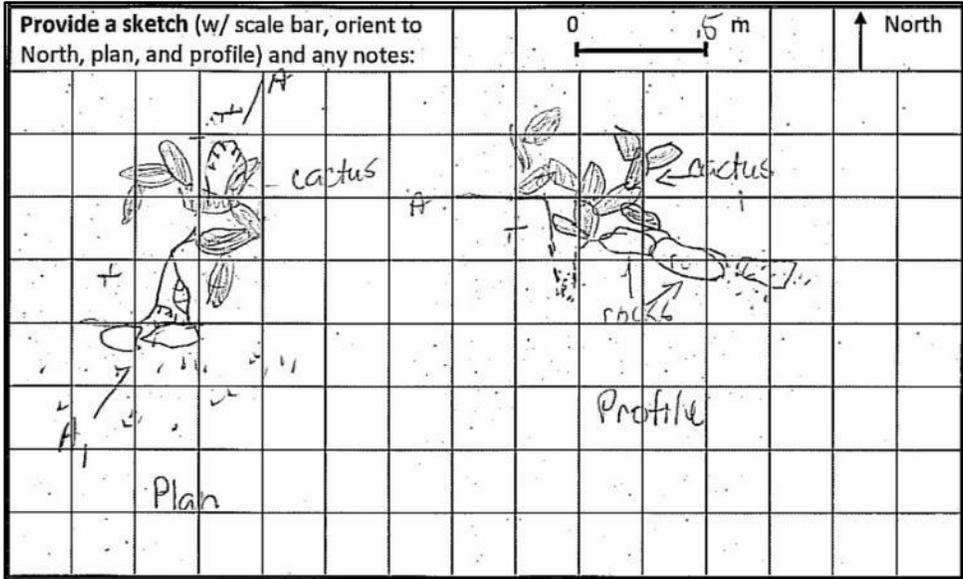

Figure 160. Field sketch of feature 1604-M14.

Figure 161. Overview of feature 1604-M14.

Figure 162. Close up of feature 1604-M14, showing ROW fence.

Feature 1604-M21 (Han's Grotto): Cave

This feature was located in Salado Creek under the west bound access road of Loop 1604 east of NW Military Highway (Figure 163 - Figure 167). It was evaluated on 6, 8 and 11 September 2000 (SWCA 2000), December 9, 2009 (Zara 2010b), and 19 June 2019 (current study). This feature measured 2.0 m (6.5 ft) wide by 3.0 m (9.8 ft) long and 0.3 m (0.98 ft) deep. It had partially been filled with concrete and was originally 16.5 m (54 ft) long, according to TSS. Prior to it being filled, biological collections made in the cave in 1984 included two troglobites, *Brackenridgia* sp. isopods and *Cambala* sp. millipedes (Table 1). SWCA (2000) reports observations made prior to the concrete plug which likely bisected the cave during construction of the bridge in April 2001. Their observations included two species of cave crickets and several troglaphiles, but no troglobites. Although it clearly contained karst invertebrate habitat, that habit was no longer accessible due to the concrete plug. This plug nearly reaches the ceiling, and excavation to re-open the cave was not feasible; therefore, no biological surveys were conducted.

Figure 166. Overview of feature 1604-M21 (Han's Grotto).

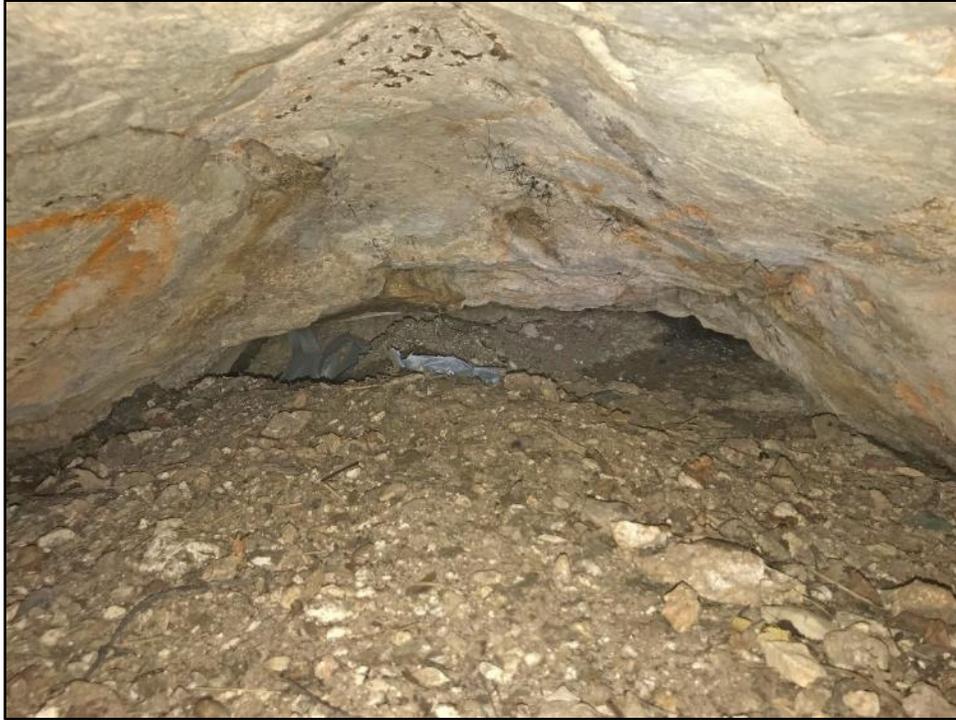

Figure 167. Interior of feature 1604-M21, showing concrete plug.

Feature 1604-M22: Solution cavities

This feature was located in a drainage under the westbound mainlanes of Loop 1604, west of Bitters Road (Figure 168 - Figure 170). It was evaluated on December 9, 2009 and 19 June 2019. This solution cavity was and 0.8 m (2.5 ft) wide, 1 m (3.2 ft) long by 0.2 m (0.66 ft) wide high, and had a second, smaller similar feature about 4 m (13.1 ft) away (1604-M22b). It was excavated on August 17, 2010 for a total of 0.6 person hours, removing 0.02 m³ (0.6 ft³) of material using hand tools. Excavation was terminated after reaching a distinct terminus with no voids or drains extending from the footprint of the feature. This feature was determined not to provide potential habitat for listed karst invertebrate species and no fauna surveys were performed (Table 2).

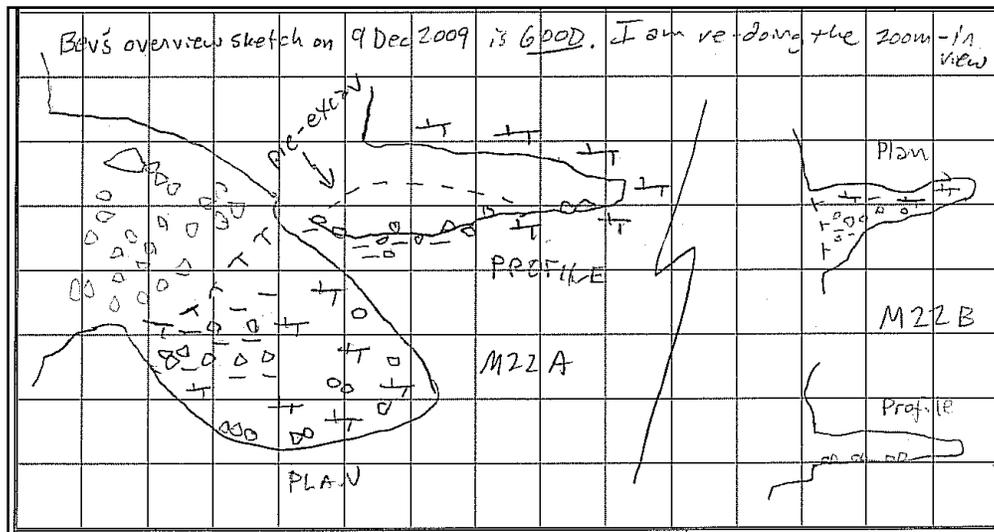

Figure 168. Detailed sketch of feature 1604-M22, showing extent of excavation and end of passage.

Figure 169. Overview of feature 1604-M22 (left) and 1604-M22b (right).

Figure 170. Interior of feature 1604-M22.

Feature 1604-Q48; Solution cavity

This feature was located in a cliff under the westbound mainlanes of Loop 1604 and west of Interstate-10 (I-10). It was evaluated on December 15, 2009 and August 30, 2019 (Figure 171 - Figure 173). The feature was a solution cavity developed along a bedding plane, and measured 1.5 m (4.9 ft) wide, 2 m (6.5 ft) long, and 0.75 m (2.5 ft) high. The floor of the feature contained loose rocks, and fine, compact soil. The 2009 evaluation indicated that excavation was warranted, and that was conducted on March 10, 2010, at which time the feature was seeping water. The back of the feature was reached 2 m (6.6 ft) in. While the feature met the length criterion for habitat, the wide opening has made the feature desiccated and therefore determined not to provide potential habitat for listed karst invertebrate species, and no fauna surveys were performed (Table 2).

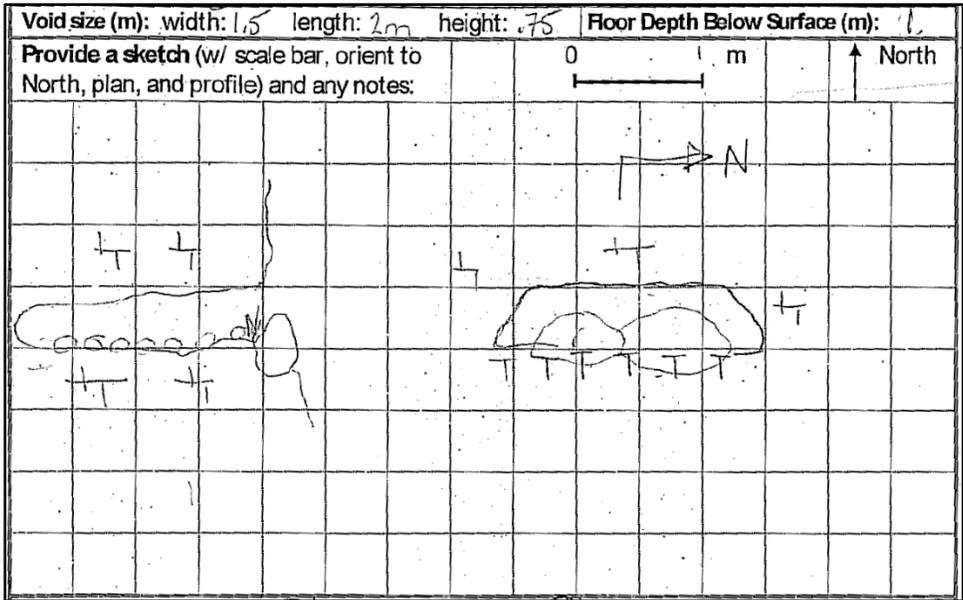

Figure 171. Field sketch of feature 1604-Q48.

Figure 172. Entrance of feature 1604-Q48.

Figure 173. Interior of feature 1604-Q48. Note the bedrock terminus.

Feature 1604-R03; Cave

This feature was located north of the westbound lanes of Loop 1604 west of I-10, on Leon Creek (Figure 174 - Figure 177). It was evaluated on December 15, 2009 and June 11, 2019. It consists of two small, humanly enterable passages stacked on top of each other. The higher passage had a rocky floor and slopes upwards to where it becomes too narrow to traverse. The lower passage was a narrow horizontal crawlway that becomes too narrow to traverse after 4.9 m (16.1 ft). Due to its length and the presence of mesocavernous voids, it was considered to be potential karst invertebrate habitat (Table 2).

Presence/absence surveys conducted in March and April 2010 detected no karst invertebrate species; however, hundreds of soft bodied ticks, which are known carriers of relapsing fever, were found in the cave. Presence/absence surveys were conducted in August 2019 by inserting traps on long poles into the cave so that surveyors would not have to risk entry (Table 26); however, no troglobites were found (Table 1, Table 27).

Feature 1604-R04; Solution-enlarged bedding plane

This feature was located in a natural cliff near the westbound lanes of Loop 1604, west of I-10 on the west bank of Leon Creek (Figure 178 - Figure 180). A feature evaluation was performed on December 15, 2009, February 25, 2010, and June 11, 2019. It was a solution-enlarged bedding plane that measured 3.0 m (9.8 ft) wide by 1.8 m (5.9 ft) long by 1.8 m (5.9 ft) high at the entrance. This feature contained rocks and leaf-litter. The feature was not humanly enterable and had no airflow. The feature was similar to other features in this cliff, and it had mesocavernous voids.

Feature 1604-R04 was considered potential karst invertebrate habitat due to void size greater than or equal to 1 m (3.3 ft) and similarity to nearby caves (Table 2).

Presence/absence surveys were conducted in August and September 2019 (Table 28); however, no troglobites were found (Table 1, Table 29).

Feature 1604-R05: Solution-enlarged bedding plane

This feature was located in a natural cliff in the west bank of Leon Creek near the westbound lanes of Loop 1604, west of I-10 (Figure 181 - Figure 182). An evaluation was performed on December 15, 2009, February 25, 2010, and June 11, 2019. The feature was a solution-enlarged bedding plane that measured 1.8 m (5.9 ft) wide by 2 m (6.6 ft) long and was 0.9 m (3 ft) high at the entrance. It was floored with bedrock. This feature was considered potential karst invertebrate habitat due to void length greater than 1 m (3.3 ft) and the presence of mesocavernous voids (Table 2). Presence/absence surveys were conducted in August and September 2019 (Table 30); however, no troglobites were found (Table 1, Table 31).

Feature 1604-R06: Solution-enlarged Bedding Plane

This feature was located north of Loop 1604, just west of I-10 (Figure 183 - Figure 185). It was assessed on December 15, 2009 and June 11, 2019. This was a 12.2 m (40.0 ft) zone of enlarged bedding planes and vuggy cliff face that extends up to 0.9 m (3.0 ft) into the rock and had an overall depth of approximately 1.8 m (5.9 ft). The feature contained breakdown, silty clay, and exposed bedrock. Due to the presence of mesocavernous voids (Table 2), it was sampled for karst fauna in March and April 2010 using traps pushed back into the voids with retrieval strings. No karst invertebrate species were detected. Presence/absence surveys were conducted in August and September 2019 (Table 32); however, no troglobites were found (Table 1).

Feature 281-117: Cave (sealed)

Feature 281-117 was encountered during construction on August 31, 2017, during the excavation of a footing for Bent 4 of the westbound Loop 1604 to northbound US 218 Direct Connect at station 207+84, on the northeast corner of Loop 1604 and US 281 (Figure 186 - Figure 188) (TxDOT 2019c). The feature was 1.5 m (4.9 ft) wide, 1.5 m (4.9 ft) long, and 2.5 m (8.2 ft) deep. The feature was evaluated the same day and found to be an enterable cave. The cave had indications of moisture, including flowstone and active drips. Organic rich sediment was also present within the cave, as were mesocavernous extensions. No airflow or troglobitic fauna were observed during the initial evaluation; however, spider webs were observed in the cave (Figure 188).

This feature was considered potential karst invertebrate habitat due to the size of the void and the presence of spider webs (Table 2). The feature was excavated by hand on September 1, 2017 to remove debris and allow space for surveyors to set traps and conduct biota surveys. Presence/absence surveys were conducted in September and October 2017;

notable fauna are summarized in Table 1 and Table 34. Karst invertebrate habitat was confirmed with the observation of troglobitic silverfish (*Texoreddellia* sp.); however, no listed species were detected. The feature was sealed after surveys were complete to continue with construction. The construction activities were covered under the 281 Biological Opinion (USFWS 2015b).

[Feature 281-121 \(Turnaround Cave\); Cave; destroyed](#)

Feature 281-121 was located on the northeast corner of northbound US 281 and the westbound turnaround of Loop 1604 (Figure 189 - Figure 191) (TxDOT 2019c). It was encountered on November 3, 2017 during the drilling of a shaft for the support structure of a flyover for the Loop 1604/US 281 interchange project (Figure 190). It was a humanly enterable, highly decorated cave. The cave chamber was 9 m (29.5 ft) long, 5 m (16.4 ft) wide, and 2.1 (6.9 ft) high. The drilling rig penetrated the ceiling of the chamber at a depth of 2.8 m (9.2 ft). The cave exhibited a range of sediment and surface types, and had active drips from ceiling formations as well as pores and jointed and fractured cracks in the limestone bedrock (Figure 191). The cave walls were a combination of calcite flowstone and

bedrock, while the cave floor was composed of bedrock, fine-grained rock sediment, red/brown and/or tan clay, dark brown mud cracks, and calcite surfaces. Prior to construction, the cave did not have an entrance or any kind of surface expression, nor was any airflow noted.

This feature was considered potential karst invertebrate habitat due to being humanly enterable, being similar to nearby caves, and its extent (Table 2). Presence/absence surveys were conducted in November and December 2017; notable fauna are summarized in Table 1 and Table 35. Karst invertebrate habitat was confirmed with the observation of troglobitic silverfish (*Texoreddellia* sp.); however, no listed species were detected. After surveys were complete, the cave was destroyed by the installation of the flyover pier (Figure 192). The construction activities were covered under the 281 Biological Opinion (USFWS 2015b).

Feature G04; Solution Cavity

This feature was located on the west side of the I-10 access road, north of Loop 1604. It was located in November 2014 as part of the I-10 managed lanes study (TxDOT 2015b) and was reassessed on September 27, 2019 as part of this study. This feature was a pair of solution cavities that was 3 m (9.8 ft) wide, 1 m (3.3 ft) in maximum length, and 0.5 m (1.6 ft) high. It contained modern soils and leaf litter. This feature was determined not to provide potential habitat for listed karst invertebrate species and no fauna surveys were performed (Table 2).

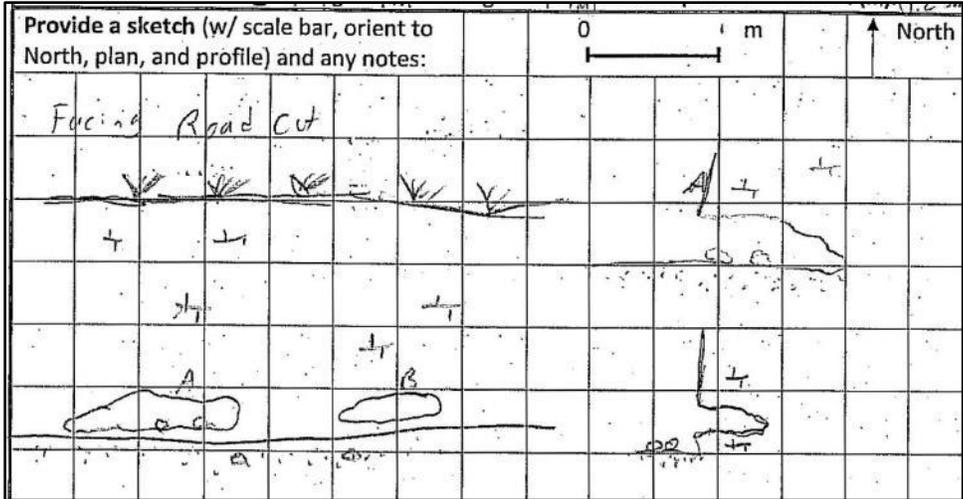

Figure 192. Field sketch of feature G04.

Figure 194. Interior view of feature G04a.

Figure 195. Interior view of feature G04b.

Feature HB-007; Zone with Solution Cavity and Solution-enlarged Bedding Plane

This feature was in the roadcut north of the westbound mainlanes of Loop 1604 east of Bitters Road. It was assessed on November 28, 2017 (Figure 196 - Figure 198) (TxDOT 2018a), then those data were examined in 2019 to verify whether the feature met current USFWS habitat criteria. This zone consists of a solution cavity 0.5 m (1.5 ft) wide by 0.6 m (2 ft) long by 0.8 m (2.5 ft) high above a solution-enlarged bedding plane that was 2.1 m (7 ft) wide by 0.2 m (0.5 ft) long by 0.2 m (0.5 ft) high. A second solution-enlarged bedding plane that was 0.5 m (1.5 ft) wide by 0.1 m (0.3 ft) long by 0.1 m (0.3 ft) high was below and to the west. The solution cavity was developed along a fracture trending 315 degrees. This feature contained fine red-soil, cobbles, vegetation, roadside debris, and bedrock. It does not have any mesocavernous voids extending from the footprint. This feature was determined not to provide potential habitat for listed karst invertibrate species and no fauna surveys were performed (Table 2).

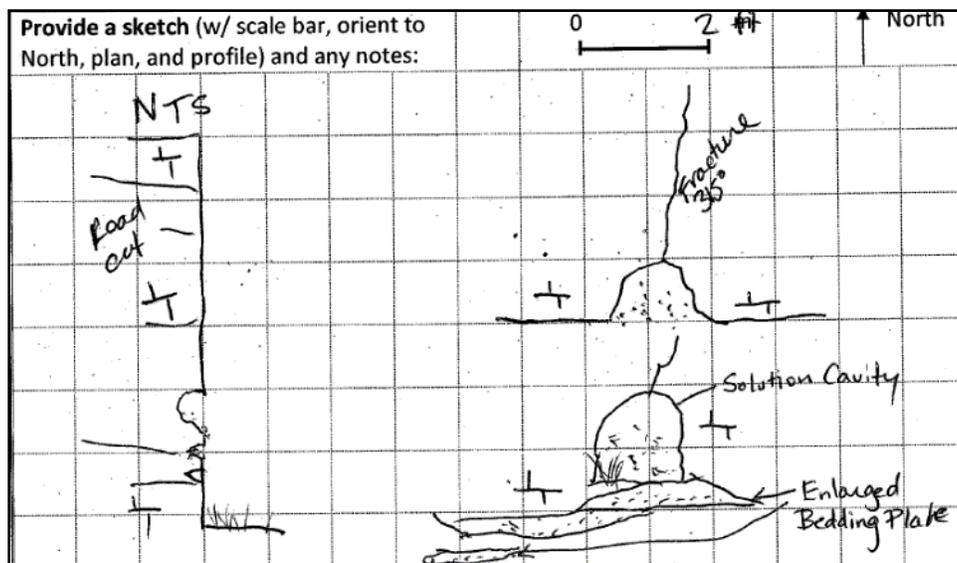

Figure 196. Field sketch of feature HB-007.

Figure 197. Overview of feature HB-007.

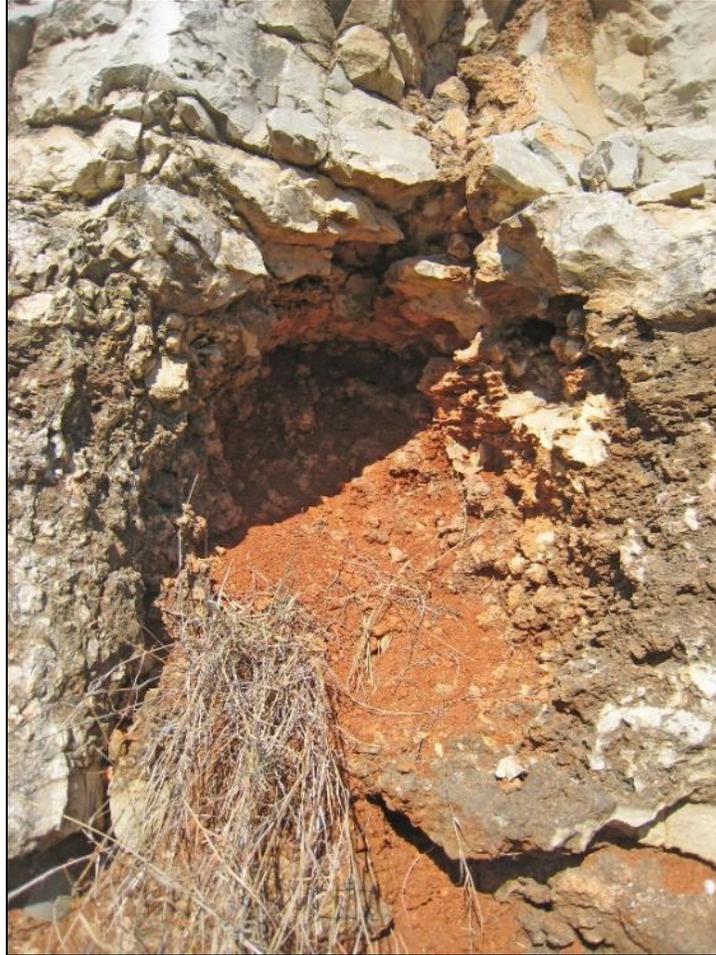

Figure 198. Interior of feature HB-007.

Feature HB-008: Solution-enlarged Bedding Plane

This feature was located in the roadcut north of the westbound mainlanes of Loop 1604, east of Bitters Road. It was evaluated on November 28, 2017, and reconnaissance excavation was performed (TxDOT 2018a), then those data were examined in 2019 to verify whether the feature met current USFWS habitat criteria. This feature was a solution-enlarged bedding plane that was 3.7 m (12 ft) wide by 0.8 m (2.5 ft) long by 2.4 m (8 ft) high that had collapsed (Figure 199 - Figure 200). This feature contained loose rocks and bedrock. Collapsed materials are accumulated below the feature along the base of the roadcut, indicating that the collapse occurred since the construction of Loop 1604 in the early 1980's. This feature was determined not to provide potential habitat for listed karst invertebrate species and no fauna surveys were performed (Table 2).

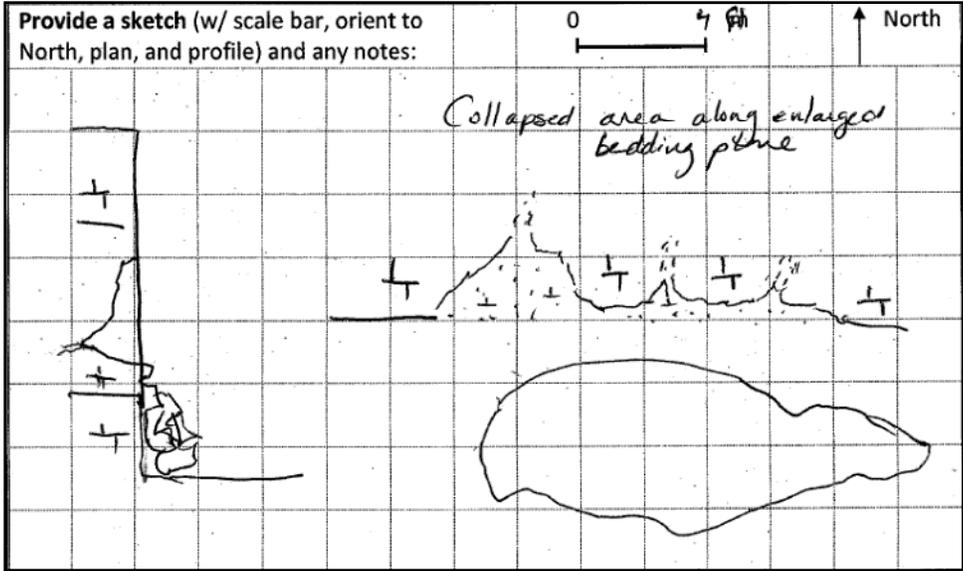

Figure 199. Field sketch of feature HB-008.

Figure 200. Overview of feature HB-008.

Feature HB-009; Solution-enlarged Bedding Plane

This feature was located in the roadcut north of the westbound mainlanes of Loop 1604, east of Bitters Road. It was evaluated on November 28, 2017 (TxDOT 2018a), then those data were examined in 2019 to verify whether the feature met current USFWS habitat criteria. This was a solution-enlarged bedding plane 2.4 m (8 ft) wide by 0.5 m (1.5 ft) long by 1.1 m (3.75 ft) tall that had collapsed (Figure 201 - Figure 203). The collapsed materials are accumulated below the feature along the base of the roadcut, indicating that the collapse occurred since the construction of Loop 1604 in the early 1980's. This feature contained stones, vegetation, and bedrock. This feature was determined not to provide potential habitat for listed karst invertebrate species and no fauna surveys were performed (Table 2).

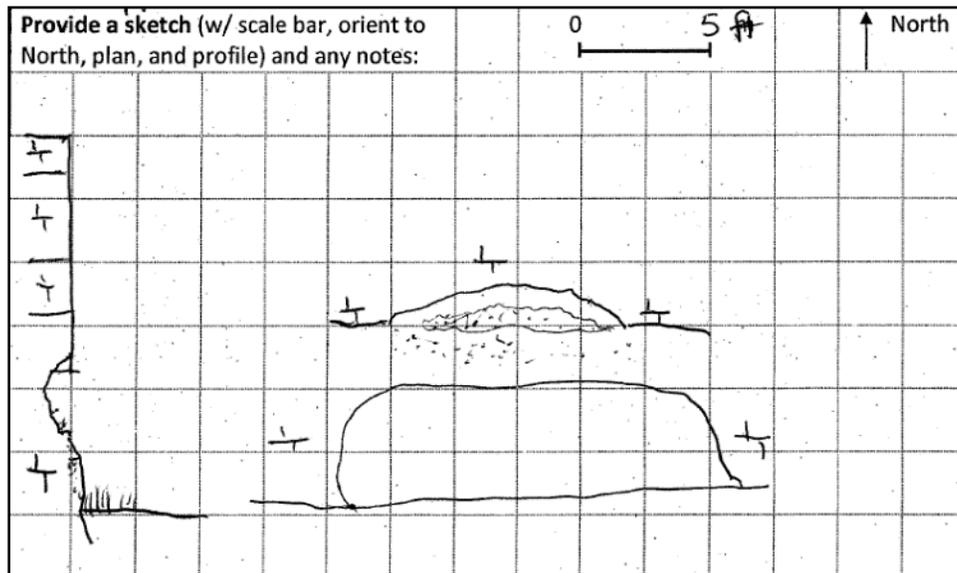

Figure 201. Field sketch of feature HB-009.

Figure 202. Overview of feature HB-009.

Figure 203. Interior of feature HB-009.

Feature HB-010: Solution Cavity

This feature was located in the roadcut north of the westbound mainlanes of Loop 1604, east of Bitters Road. It was evaluated on November 28, 2017 (TxDOT 2018a), then those data were examined in 2019 to verify whether the feature met current USFWS habitat criteria. This solution cavity was 0.3 m (1 ft) wide by 0.5 m (1.75 ft) long by 0.3 m (1 ft) high (Figure 204 - Figure 206). This feature contained fine red-tan soils and bedrock. This feature was determined not to provide potential habitat for listed karst invertebrate species and no fauna surveys were performed (Table 2).

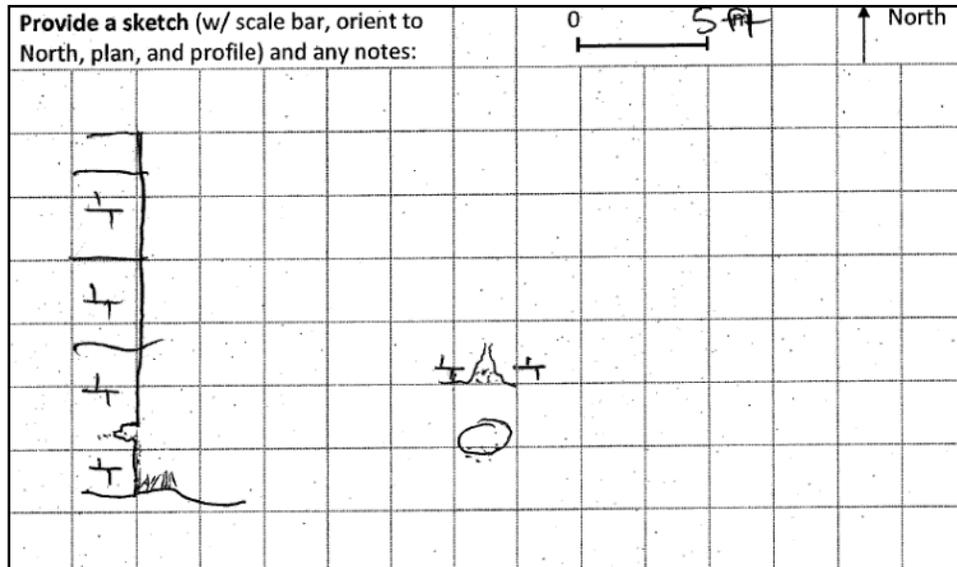

Figure 204. Field sketch of feature HB-010.

Figure 205. Overview of feature HB-010.

Figure 206. Interior of feature HB-010.

[Feature HB-013; Zone with Solution Cavity and Solution-enlarged Bedding Plane](#)

This feature was located in the roadcut north of the westbound mainlanes of Loop 1604, east of Bitters Road. It was evaluated on November 28, 2017 (TxDOT 2018a), then those data were examined in 2019 to verify whether the feature met current USFWS habitat criteria. This zone includes a solution cavity that was 0.6 m (2 ft) wide by 0.6 m (2 ft) long by 1.1 m (3.5 ft) high and a solution-enlarged bedding plane that was 1.2 m (4 ft) wide by 0.6 m (2 ft) long by 0.3 m (1 ft) high (Figure 207 - Figure 209). This feature contained red fine soils, cobbles, vegetation, and bedrock. This feature was determined not to provide potential habitat for listed karst invertebrate species and no fauna surveys were performed (Table 2).

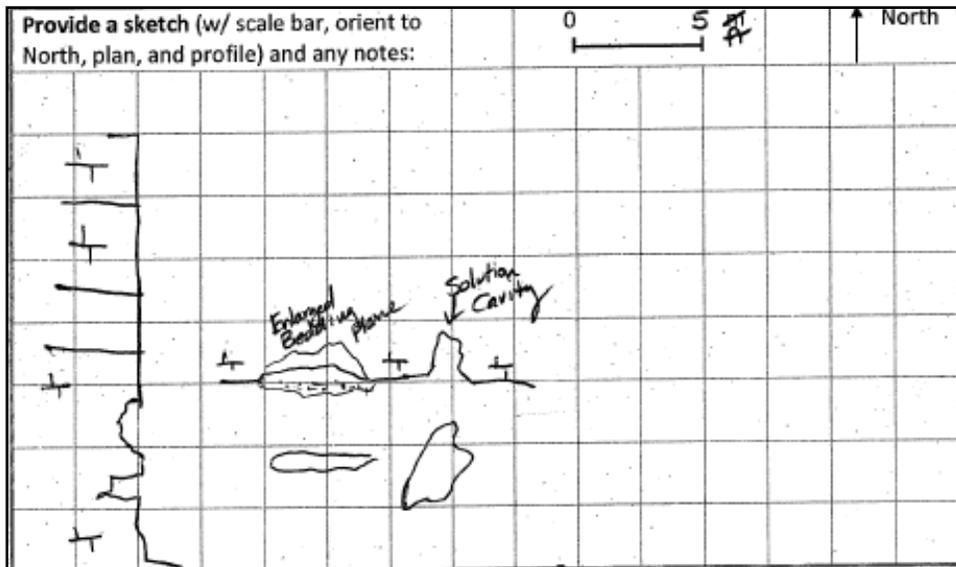

Figure 207. Field sketch of feature HB-013.

Figure 208. Overview of feature HB-013.

Figure 209. Interior of feature HB-013.

Feature HB-014: Zone with Sinkhole and Solution-enlarged Bedding Plane

This feature was located in the roadcut north of the westbound mainlanes of Loop 1604, east of Bitters Road. This feature was originally described as 1604-W07; however, due to the distance from the original GPS point, the feature was re-described as HB-014 on November 28, 2017 (TxDOT 2018a). In 2019, the original data were examined to verify whether the feature met current USFWS habitat criteria. This feature was a zone containing a bisected collapsed sinkhole and a solution-enlarged bedding plane. The zone containing the features was 4.6 m (15 ft) wide by 1.2 m (4 ft) long by 3.7 m (12 ft) high (Figure 210 - Figure 213). Both features appear to have collapsed after the original construction of Loop 1604, based on the materials accumulated below the features. This zone of features was infilled with coarse soils, cobbles, vegetation, and bedrock. This feature was determined not to provide potential habitat for listed karst invertebrate species and no fauna surveys were performed (Table 2).

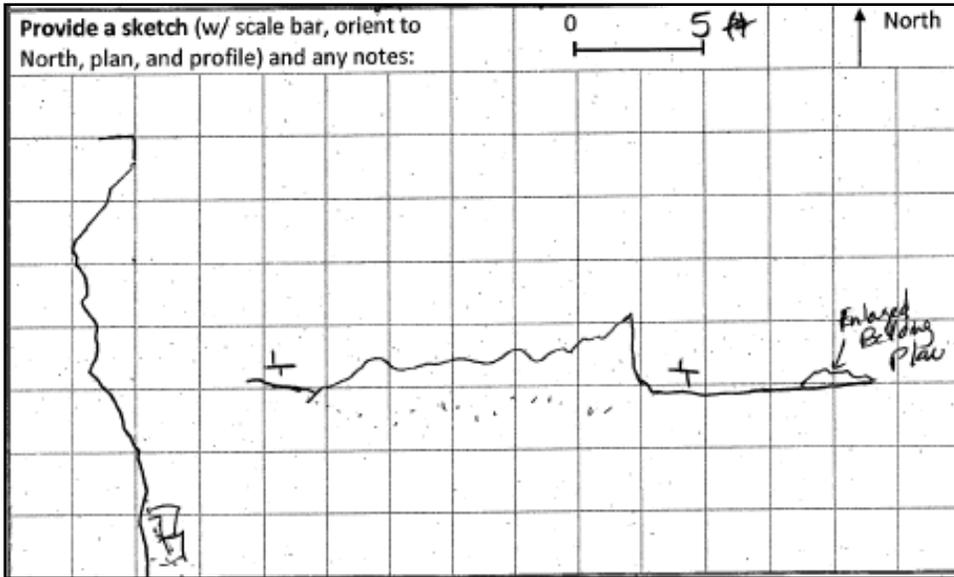

Figure 210. Field sketch of feature HB-014.

Figure 211. Overview of feature HB-014.

Figure 212. Overview of the sinkhole portion of HB-014.

Figure 213. Interior of the solution-enlarged bedding plane portion of feature HB-014.

Feature HB-016; Zone with Solution Cavities

This feature was located in the roadcut north of the westbound mainlanes of Loop 1604 west of Bitters Road. It was evaluated on November 28, 2017 (TxDOT 2018a), then those data were examined in 2019 to verify whether the feature met current USFWS habitat criteria. This zone includes two solution cavities, the largest of which was 1.5 m (5 ft) wide by 0.5 m (1.5 ft) long by 0.9 m (3 ft) high (Figure 214 - Figure 215). The solution cavities are infilled with fine red clay and bedrock. This feature was determined not to provide potential habitat for listed karst invertebrate species and no fauna surveys were performed (Table 2).

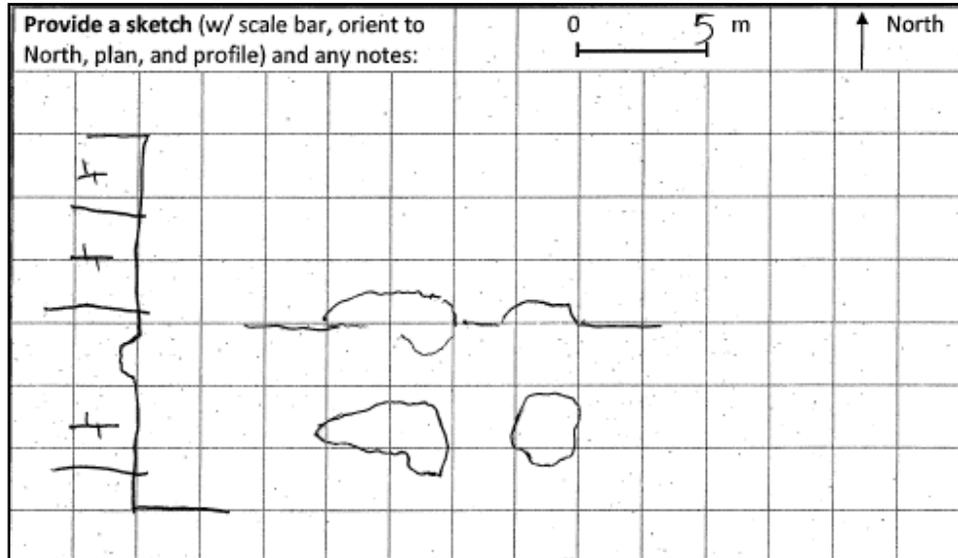

Figure 214. Field sketch of feature HB-016.

Figure 215. Overview of feature HB-016.

Feature HB-018: Solution-enlarged Bedding Plane

This feature was located in the roadcut north of the westbound mainlanes of Loop 1604, west of Bitters Road. It was evaluated on November 28, 2017 (TxDOT 2018a), then those data were examined in 2019 to verify whether the feature met current USFWS habitat criteria. This solution-enlarged bedding plane was 1.5 m (5 ft) wide by 0.6 m (2 ft) long by 0.6 m (2 ft) tall (Figure 216 - Figure 217). This feature contained fine red soils, cobbles, and bedrock. This feature was determined not to provide potential habitat for listed karst invertebrate species and no fauna surveys were performed (Table 2).

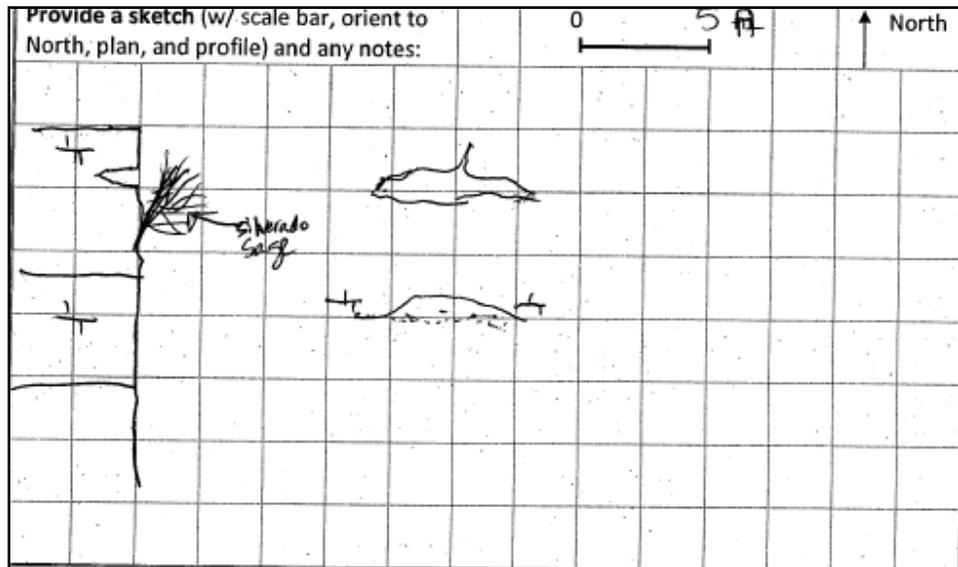

Figure 216. Field sketch of feature HB-018.

Figure 217. Overview of feature HB-018.

Feature HB-019; Solution Cavity

This feature was located in the roadcut north of the westbound mainlanes of Loop 1604, west of Bitters Road and originally assessed as part of another study (TxDOT 2018a). The data from that study were examined in 2019 to verify whether the feature met current USFWS habitat criteria. This solution cavity was 0.8 m (2.5 ft) wide by 0.5 m (1.5 ft) long by 1.8 m (6 ft) high (Figure 218 - Figure 220). This feature contained fine red soils, cobbles, and bedrock. This feature was determined not to provide potential habitat for listed karst invertebrate species and no fauna surveys were performed (Table 2).

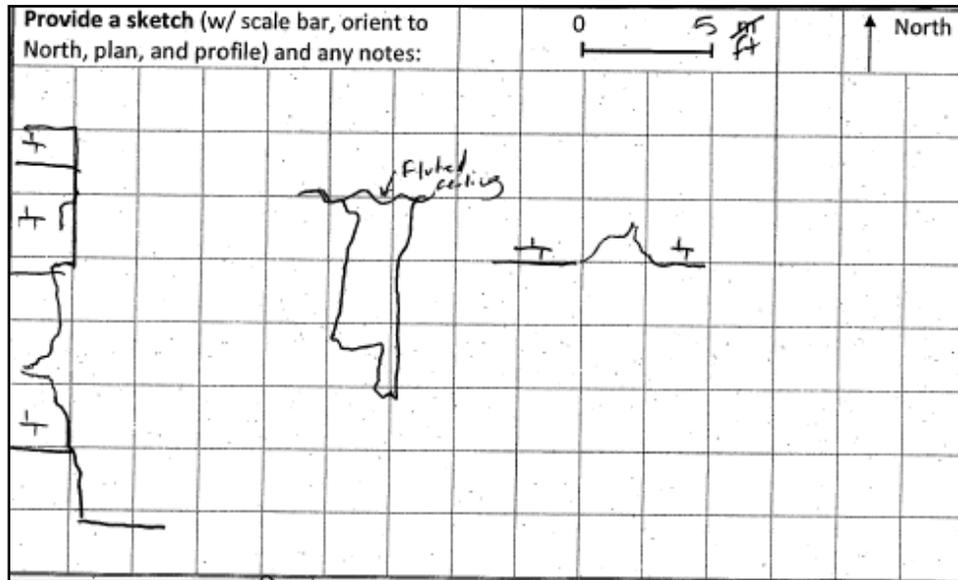

Figure 218. Field sketch of feature HB-019.

Figure 219. Overview of feature HB-019.

Figure 220. Close up of feature HB-019.

Feature HB-020: Solution Cavity

This feature was located in the roadcut north of the westbound mainlanes of Loop 1604 west of Bitters Road and originally assessed as part of another study (TxDOT 2018a). The data from that study were examined in 2019 to verify whether the feature met current USFWS habitat criteria. This solution cavity was 0.8 m (2.5 ft) wide by 0.8 m (2.5 ft) long by 1.2 m (4 ft) high (Figure 221 - Figure 222). This feature contained fine to coarse red soils, cobbles, and bedrock. This feature was determined not to provide potential habitat for listed karst invertebrate species and no fauna surveys were performed (Table 2).

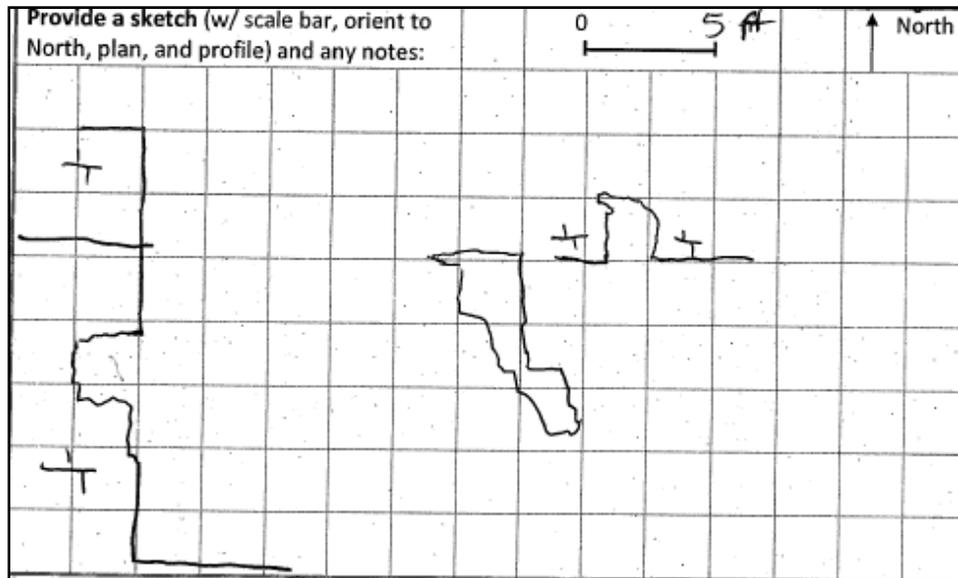

Figure 221. Field sketch of feature HB-020.

Figure 222. Overview of feature HB-020.

Feature HB-021; Zone with Solution Cavity and Solution-enlarged Bedding Plane

This feature was located in the roadcut north of the westbound mainlanes of Loop 1604 west of Bitters Road. It was evaluated on November 28, 2017 (TxDOT 2018a) and July 3, 2019. This feature was a zone containing a solution cavity and a solution-enlarged bedding plane. The zone containing the features was 1.5 m (5 ft) wide by 0.8 m (2.5 ft) long by 0.5 m (1.5 ft) high with the largest void aperture at 0.5 m (1.5 ft) (Figure 223 - Figure 225). These features contain coarse to fine red clay, cobbles, vegetation, and bedrock. This feature was determined not to provide potential habitat for listed karst invertebrate species and no fauna surveys were performed (Table 2).

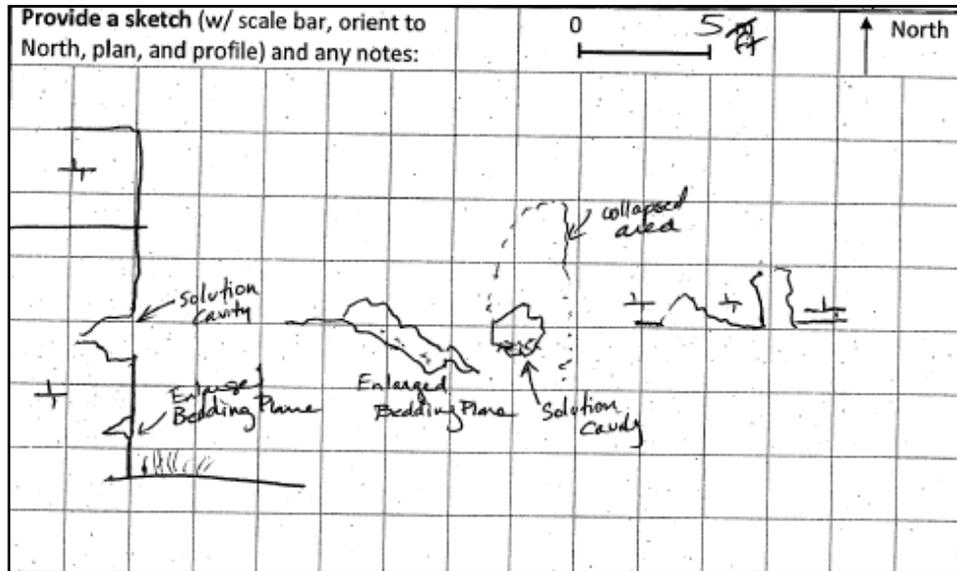

Figure 223. Field sketch of feature HB-021.

Figure 224. Overview of feature HB-021.

Figure 225. Interior of the solution cavity portion of feature HB-021, showing red terra rosa clay.

Feature HB-022: Sinkhole

This feature was located in the roadcut north of the westbound mainlanes of Loop 1604, west of Bitters Road and originally assessed as part of another study (TxDOT 2018a). The data from that study were examined in 2019 to verify whether the feature met current USFWS habitat criteria. This collapsed sinkhole, bisected by the roadcut was 3.7 m (12 ft) wide by 0.9 m (3 ft) long by 3.7 m (12 ft) high (Figure 226 - Figure 227). It appears to have collapsed after the roadcut was made for the original construction of Loop 1604 in the early 1980's. This feature contained coarse to fine red soils, cobbles, flowstone on the interior wall, vegetation, and bedrock. This feature was determined not to provide potential habitat for listed karst invertebrate species and no fauna surveys were performed (Table 2).

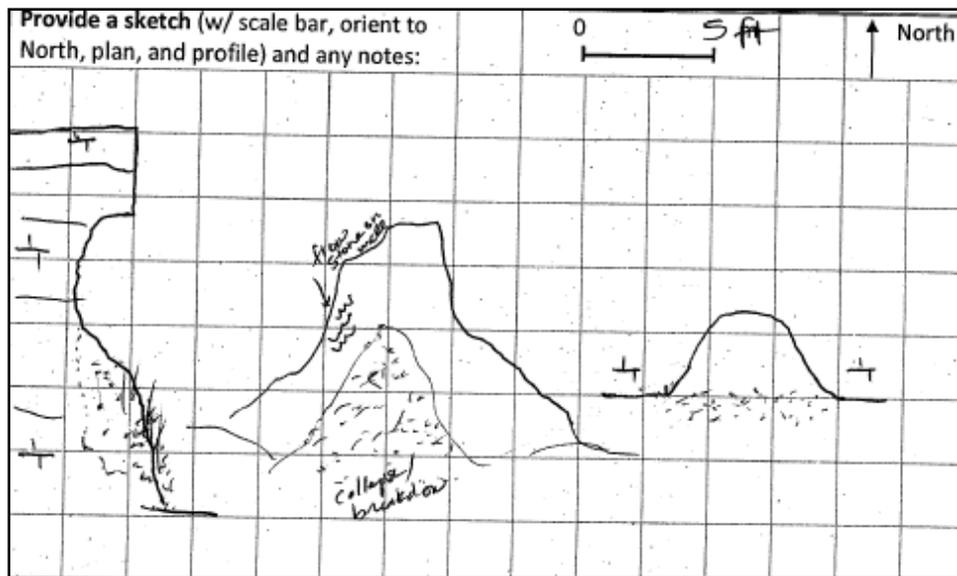

Figure 226. Field sketch of feature HB-022.

Figure 227. Overview of feature HB-022.

Feature HB-023: Solution Cavity

This feature was located in the roadcut north of the westbound mainlanes of Loop 1604, east of Huebner Road (Figure 228 - Figure 230). It was evaluated on November 29, 2017 (TxDOT 2018a), then those data were examined in 2019 to verify whether the feature met current USFWS habitat criteria. This solution cavity measured 0.3 m (1 ft) wide by 0.4 m (1.25 ft) long by 0.2 m (0.5 ft) high and contained breakdown, fine soil, and exposed bedrock. The feature was located 0.5 m (1.5 ft) above the base of the roadcut and appears to have a mesocavernous extension into the roadcut (Figure 230). This feature was determined not to provide potential habitat for listed karst invertebrate species and no fauna surveys were performed (Table 2).

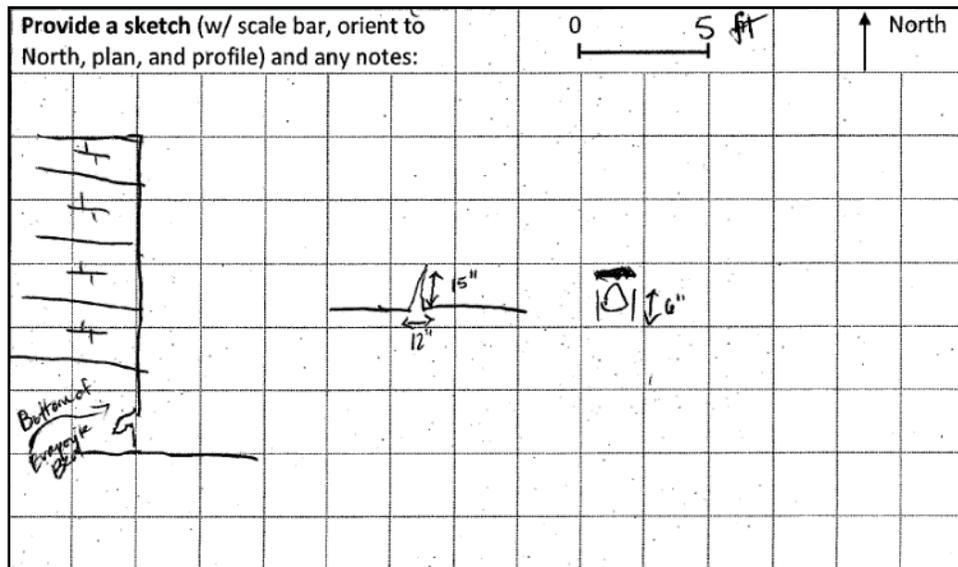

Figure 228. Field sketch of feature HB-023.

Figure 229. Overview of feature HB-023.

Figure 230. Interior of feature HB-023.

Feature HB-024; Sinkhole

This feature was located in the roadcut north of the westbound mainlanes of Loop 1604, west of Huebner Road (Figure 231 - Figure 232). It was evaluated on November 29, 2017 (TxDOT 2018a), then those data were examined in 2019 to verify whether the feature met current USFWS habitat criteria. This sinkhole, which was bisected by the roadcut, measured 1.8 m (6 ft) wide by 0.9 m (3 ft) long by 3.7 m (12 ft) high. It was located and contained breakdown, fine red clay, cobbles, vegetation, and exposed bedrock. The feature was located approximately 2.1 m (7 ft) above the base of the roadcut. This feature was determined not to provide potential habitat for listed karst invertebrate species and no fauna surveys were performed (Table 2).

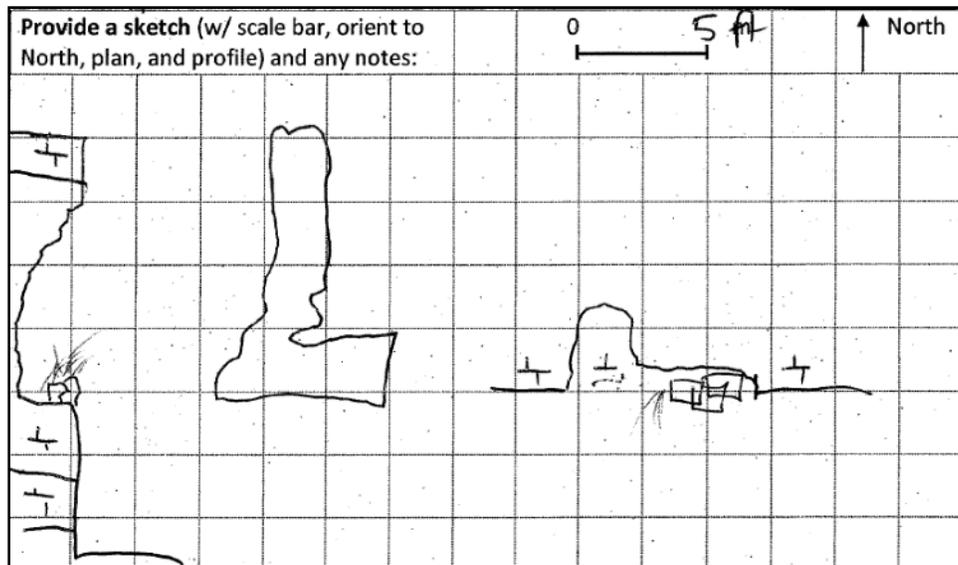

Figure 231. Field sketch of feature HB-024.

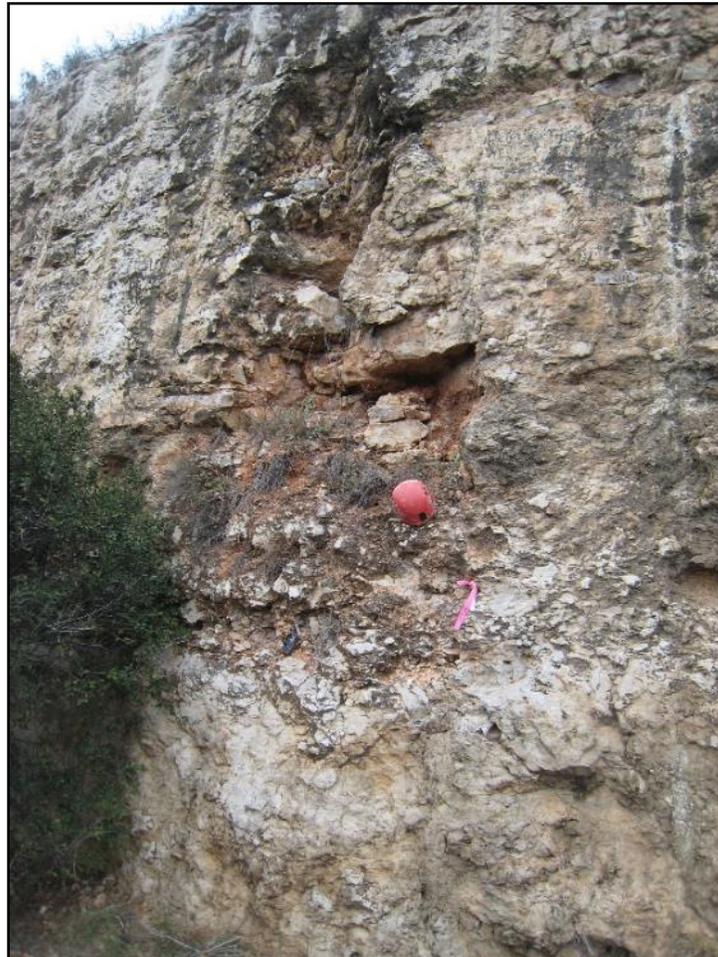

Figure 232. Overview of feature HB-024.

Feature HB-026: Solution Cavity

This feature was located in the roadcut south of the eastbound mainlanes of Loop 1604, west of Bitters Road. It was evaluated on November 29, 2017 (TxDOT 2018a), then those data were examined in 2019 to verify whether the feature met current USFWS habitat criteria. This solution cavity was 0.1 m (0.3 ft) wide by 0.6 m (2 ft) long by 0.5 m (1.5 ft) high and trends into the roadcut at 180 degrees (Figure 233 - Figure 235). This feature contained fine red soils and bedrock. This feature was determined not to provide potential habitat for listed karst invertebrate species and no fauna surveys were performed (Table 2).

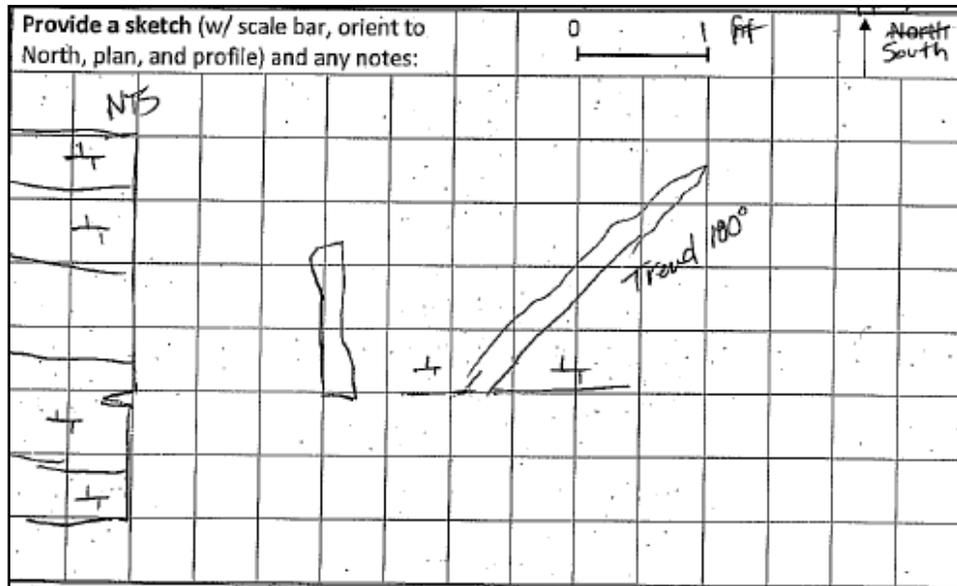

Figure 233. Field sketch of feature HB-026.

Figure 234. Overview of feature HB-026.

Figure 235. Interior of feature HB-026.

Feature HB-027; Solution Cavity

This feature was located in the roadcut south of the eastbound mainlanes of Loop 1604 west of Bitters Road. It was evaluated on November 29, 2017 (TxDOT 2018a), then those data were examined in 2019 to verify whether the feature met current USFWS habitat criteria. This solution cavity, developed on a solution-enlarged bedding plane was 4.6 m (15 ft) wide by 1.5 m (5 ft) long by 3.7 m (12 ft) high (Figure 236 - Figure 238). This feature contained coarse to fine red-tan soils, cobbles, vegetation, and bedrock. This feature was determined not to provide potential habitat for listed karst invertebrate species and no fauna surveys were performed (Table 2).

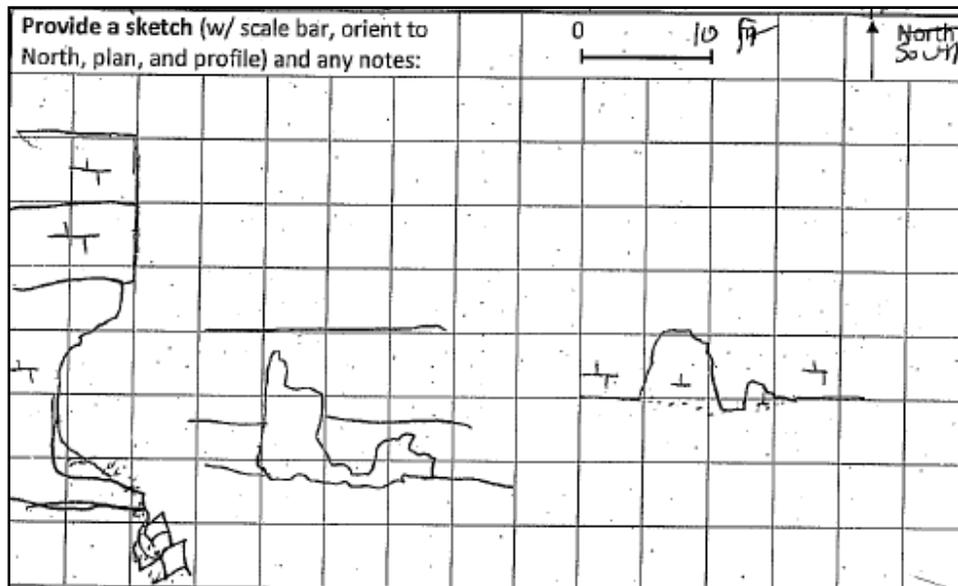

Figure 236. Field sketch of feature HB-027.

Figure 237. Overview of feature HB-027.

Figure 240. Overview of feature HB-029.

[Feature HB-030: Solution-enlarged Bedding Plane](#)

This feature was located in the roadcut south of the eastbound mainlanes of Loop 1604, east of Bitters Road. It was evaluated on November 29, 2017 (TxDOT 2018a), then those data were examined in 2019 to verify whether the feature met current USFWS habitat criteria. This solution-enlarged bedding plane was 2.4 m (8 ft) wide by 1.1 m (3.6 ft) long by 0.2 m (0.75 ft) tall (Figure 241 - Figure 242). This feature contained only exposed bedrock. This feature was determined not to provide potential habitat for listed karst invertebrate species and no fauna surveys were performed (Table 2).

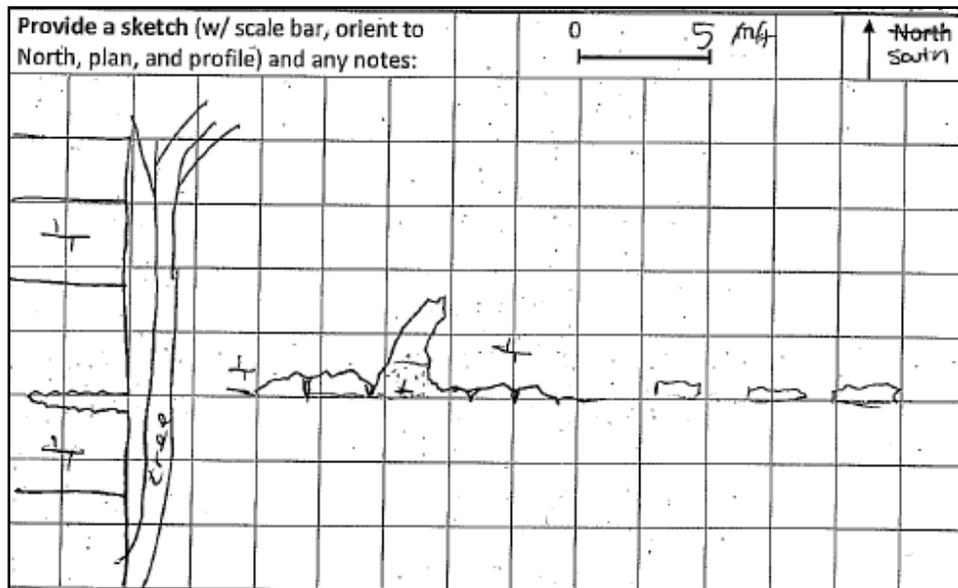

Figure 241. Field sketch of feature HB-030.

Figure 242. Overview of feature HB-030.

Feature HB-031: Sinkhole

This feature was located in the roadcut south of the eastbound mainlanes of Loop 1604, west of Huebner Road (Figure 243 - Figure 245) and originally assessed as part of another study (TxDOT 2018a). The data from that study were examined in 2019 to verify whether the feature met current USFWS habitat criteria. This sinkhole, which was bisected by the roadcut, measured 2.1 m (7 ft) wide by 1.1 m (3.5 ft) long by 2.9 m (9.5 ft) high. It contained breakdown, fine red clay, cobbles, vegetation, and exposed bedrock. The feature had no visible mesocavernous extensions, but appears to be developed laterally along a bedding plane. The feature was located approximately 0.8 m (2.5 ft) above the base of the roadcut. This feature was determined not to provide potential habitat for listed karst invertebrate species and no fauna surveys were performed (Table 2).

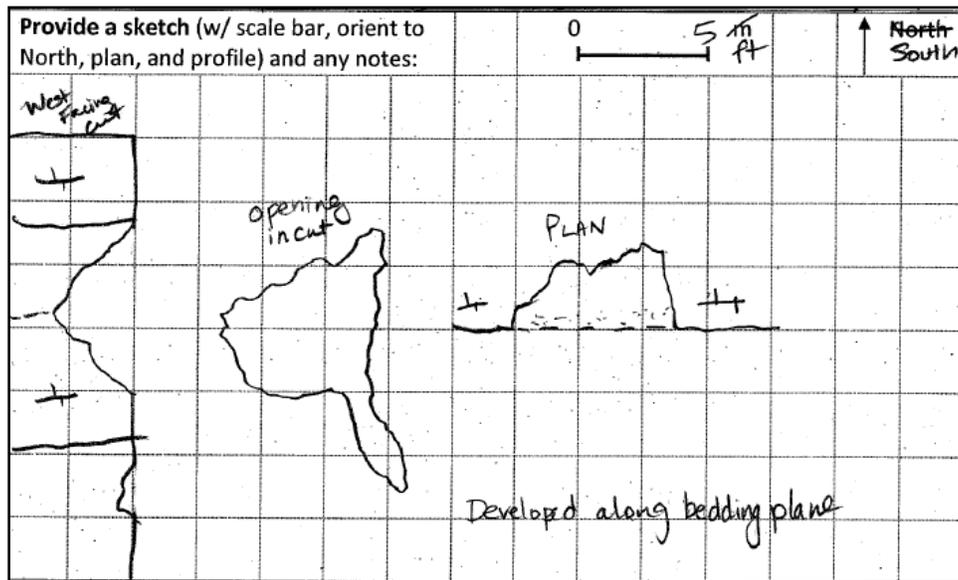

Figure 243. Field sketch of feature HB-031.

Figure 244. Overview of feature HB-031.

Figure 245. Infill and interior of feature HB-031.

Feature HB-032: Solution Cavities

This feature was located in the roadcut south of the eastbound mainlanes of Loop 1604, west of Huebner Road (Figure 246 - Figure 247). It was evaluated on November 30, 2017 (TxDOT 2018a), then those data were examined in 2019 to verify whether the feature met current USFWS habitat criteria. This feature includes two solution cavities bisected by the roadcut, the largest of which measured 1.5 m (5 ft) wide by 1.2 m (4 ft) long by 1.2 m (4 ft) high. The features contain, fine red-brown clay, cobbles, vegetation, and exposed bedrock. The feature had no visible mesocavernous extensions, but appears to be developed laterally along a bedding plane. The feature was located approximately 2.3 m (7.5 ft) above the base of the roadcut. This feature was determined not to provide potential habitat for listed karst invertibrate species and no fauna surveys were performed (Table 2).

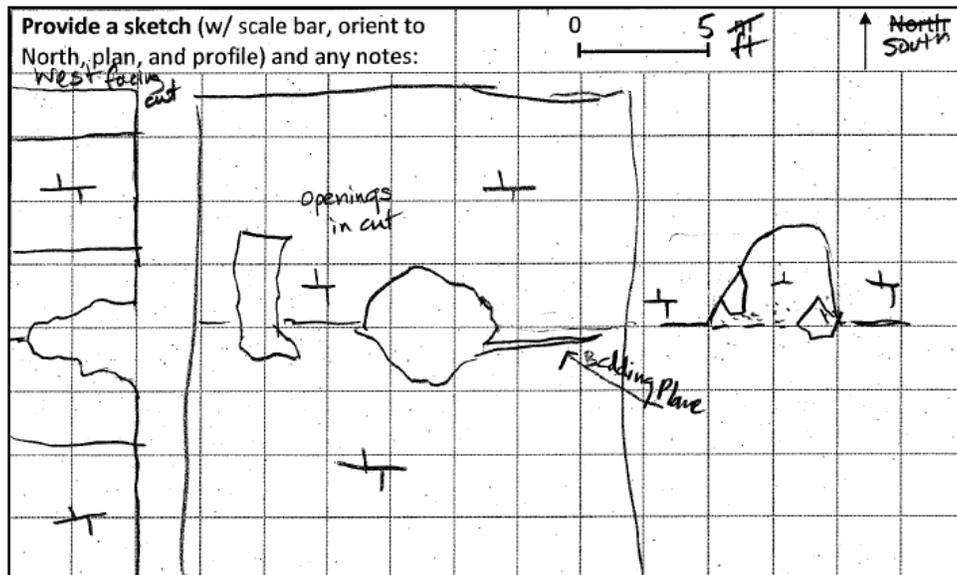

Figure 246. Field sketch of feature HB-032.

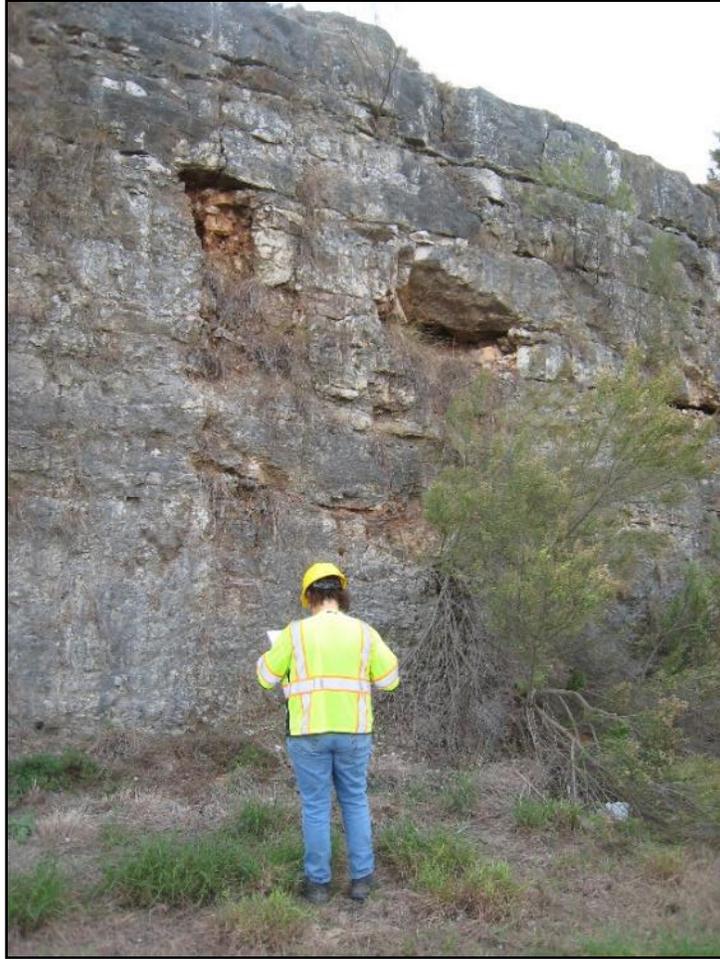

Figure 247. Overview of feature HB-032.

Feature HB-033; Solution Cavities

This feature was located in the roadcut south of the eastbound mainlanes of Loop 1604 west of Huebner Road (Figure 248 - Figure 249). It was evaluated on November 30, 2017 (TxDOT 2018a), then those data were examined in 2019 to verify whether the feature met current USFWS habitat criteria. This feature includes two solution cavities bisected by the roadcut that are connected along a solution-enlarged bedding plane 6 m (20 ft) wide by 0.9 m (3 ft) long by 1.5 m (5 ft) high. The features contain fine red-brown clay, cobbles, vegetation, and exposed bedrock. The feature was located approximately 2 m (6.5 ft) above the base of the roadcut. This feature was determined not to provide potential habitat for listed karst invertebrate species and no fauna surveys were performed (Table 2).

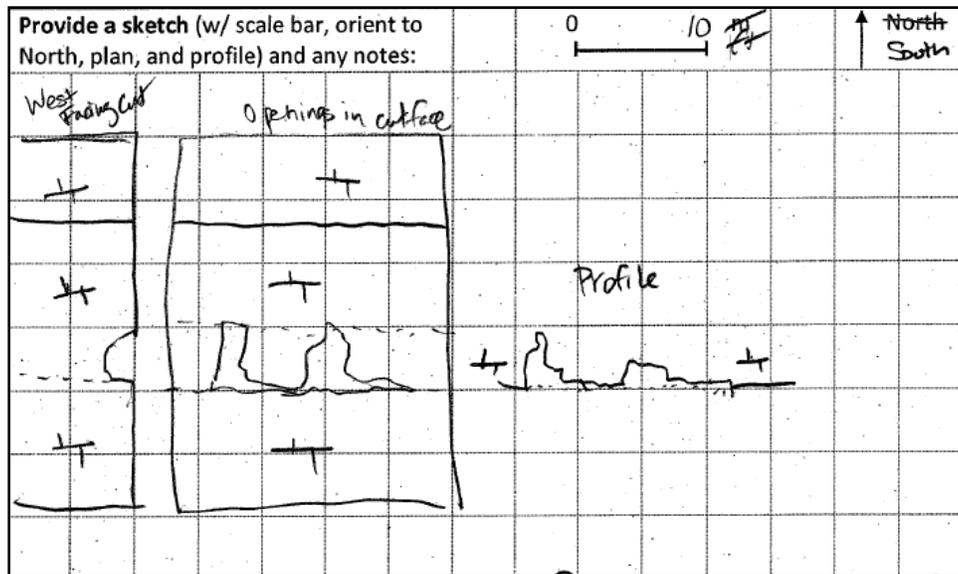

Figure 248. Field sketch of feature HB-033.

Figure 249. Overview of feature HB-033.

Feature HB-034; Solution-enlarged Bedding Plane

This feature was located in the roadcut south of the eastbound mainlanes of Loop 1604, west of Huebner Road (Figure 250 - Figure 252). It was evaluated on November 30, 2017 (TxDOT 2018a), then those data were examined in 2019 to verify whether the feature met current USFWS habitat criteria. This feature was in the area originally described as feature 1604-W06 (Zara 2010a); however, it was located with enough distance from other features to re-describe it a distinct feature. This solution-enlarged bedding plane measured 0.3 m (1 ft) wide by 0.8 m (2.5 ft) long by 0.1 m (0.3 ft) high. It narrows as it extends into the roadcut and appears to terminate in bedrock. This feature was infilled with fine brown soil, loose rocks, and bedrock. This feature was determined not to provide potential habitat for listed karst invertebrate species and no fauna surveys were performed (Table 2).

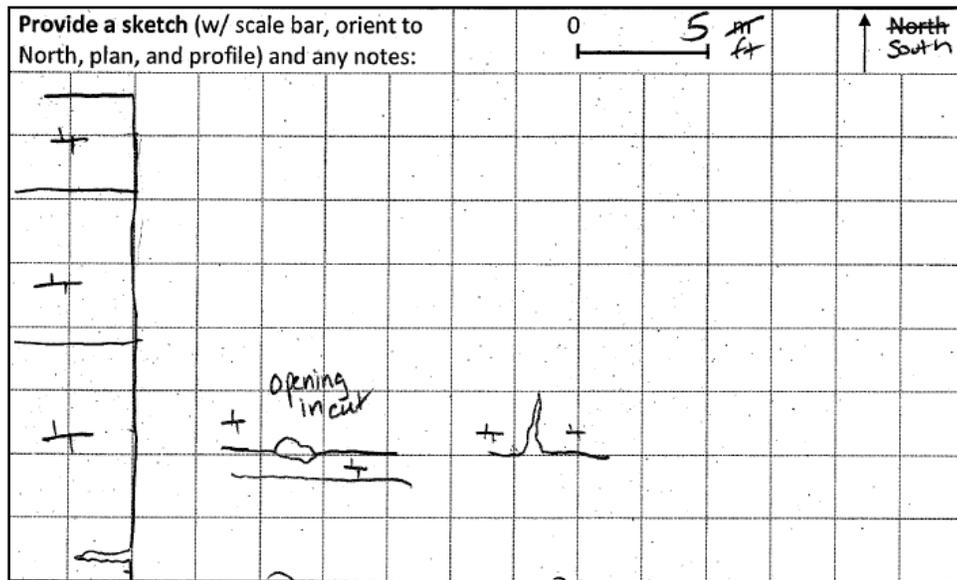

Figure 250. Field sketch of feature HB-034.

Figure 251. Overview of feature HB-034.

Figure 252. Interior of feature HB-034.

Feature HB-035: Solution-enlarged Bedding Plane

This feature was located in the roadcut south of the eastbound mainlanes of Loop 1604, west of Huebner Road (Figure 253 - Figure 254). It was evaluated on November 30, 2017 (TxDOT 2018a), then those data were examined in 2019 to verify whether the feature met current USFWS habitat criteria. This feature was in the area originally described as feature 1604-W06 (Zara 2010a); however, it was located with enough distance from other features to re-describe it a distinct feature. This solution-enlarged bedding plane measured 6.1 m (20 ft) wide by 1.2 m (4 ft) long by 0.6 m (2 ft) high. It narrows as it extends into the roadcut and appears to terminate in bedrock. This feature was infilled with fine red-tan soil, loose rocks, and bedrock. This feature was determined not to provide potential habitat for listed karst invertebrate species and no fauna surveys were performed (Table 2).

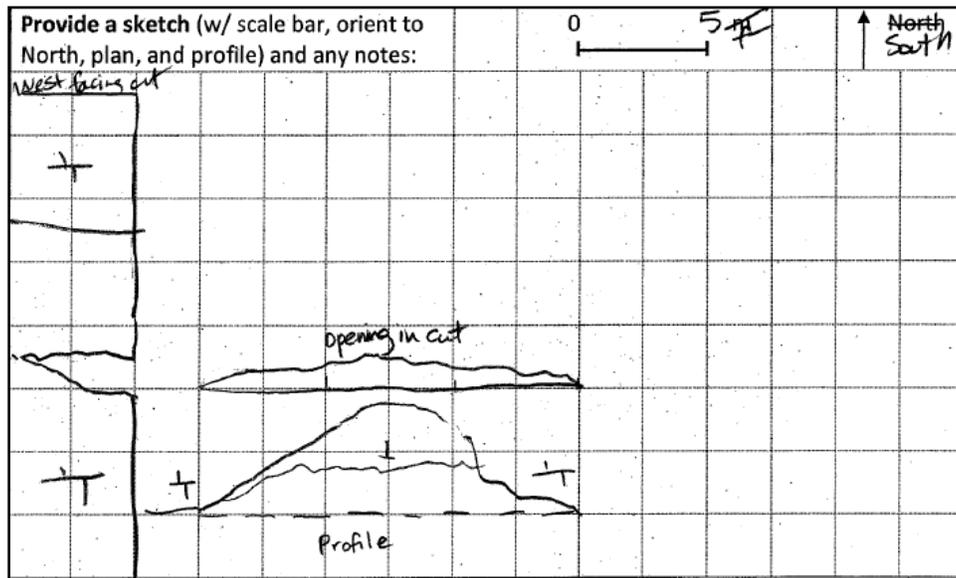

Figure 253. Field sketch of feature HB-035.

Figure 254. Overview of feature HB-035.

Feature HB-036: Zone with Solution-enlarged Bedding Plane and Solution Cavities

This feature was located in the roadcut south of the eastbound mainlanes of Loop 1604 immediately east of the Huebner Road overpass (Figure 255 - Figure 257). It was evaluated on November 30, 2017 (TxDOT 2018a), then those data were examined in 2019 to verify whether the feature met current USFWS habitat criteria. The feature was determined to be a solution-enlarged bedding plane that was 4.6 m (15 ft) wide by 0.6 m (2 ft) long by 1.2 m (4 ft) high. The solution-enlarged bedding plane contained approximately eight solution cavities, the largest of which had an aperture of 0.2 m (0.5 ft) in diameter. This feature contained fine red-brown soil, cobbles, vegetation, and bedrock. This feature was determined not to provide potential habitat for listed karst invertebrate species and no fauna surveys were performed (Table 2).

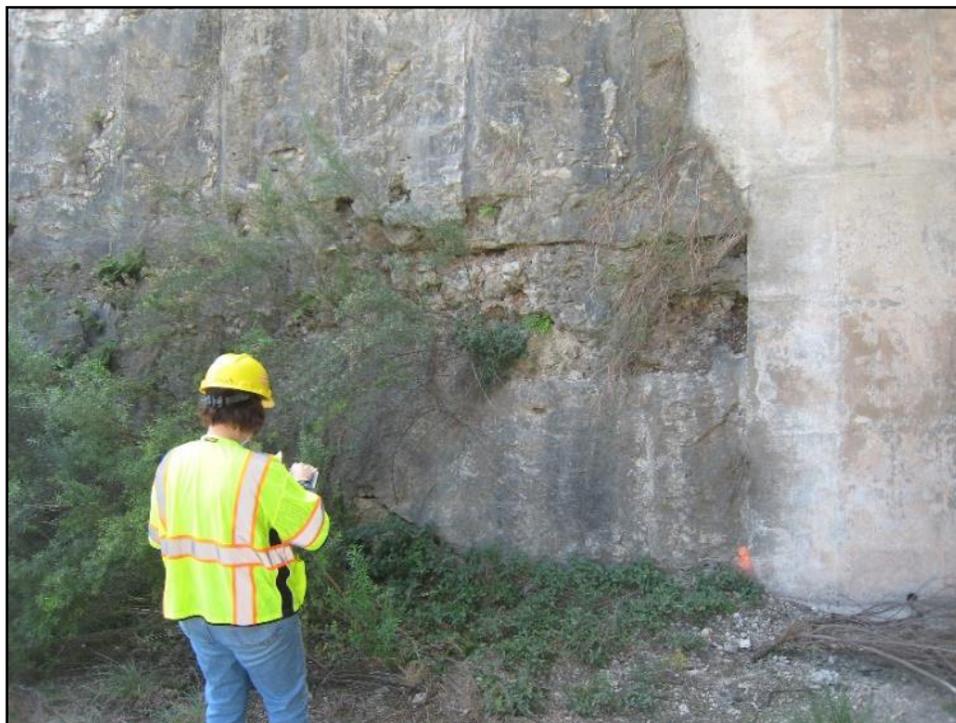

Figure 256. Overview of feature HB-036. Note the concrete apron of the Huebner Road bridge on the right side of the photo.

Figure 257. Close-up of feature HB-036 showing ferns growing from feature.

Feature HB-037: Solution-enlarged Bedding Plane

This feature was located in the roadcut south of the eastbound mainlanes of Loop 1604 east of Huebner Road (Figure 258 - Figure 259) and originally assessed as part of another study (TxDOT 2018a). The data from that study were examined in 2019 to verify whether the feature met current USFWS habitat criteria. This feature was a solution-enlarged bedding plane 21.3 m (70 ft) wide by 0.6 m (2 ft) long by 0.9 m (3 ft) high. The feature contained fine red clay soil, rocky breakdown, vegetation, and exposed bedrock. The feature was located approximately 1.8 m (6 ft) above of the base of the roadcut. This feature was determined not to provide potential habitat for listed karst invertebrate species and no fauna surveys were performed (Table 2).

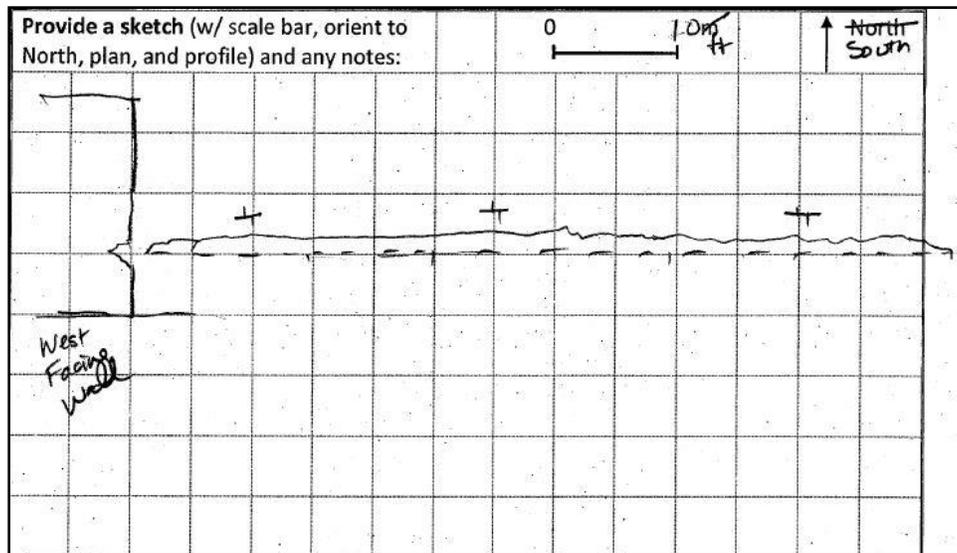

Figure 258. Field sketch of feature HB-037.

Figure 259. Overview of feature HB-037.

Feature HB-038; Solution Cavity

This feature was located in the roadcut south of the eastbound mainlanes of Loop 1604, east of Huebner Road (Figure 260 - Figure 262) and originally assessed as part of another study (TxDOT 2018a). The data from that study were examined in 2019 to verify whether the feature met current USFWS habitat criteria. This solution cavity measured 0.3 m (1 ft) wide by 0.7 m (2.2 ft) long and was 0.3 m (1 ft) high. This feature contained loose rocks and exposed bedrock (Figure 262). This feature was determined not to provide potential habitat for listed karst invertebrate species and no fauna surveys were performed (Table 2).

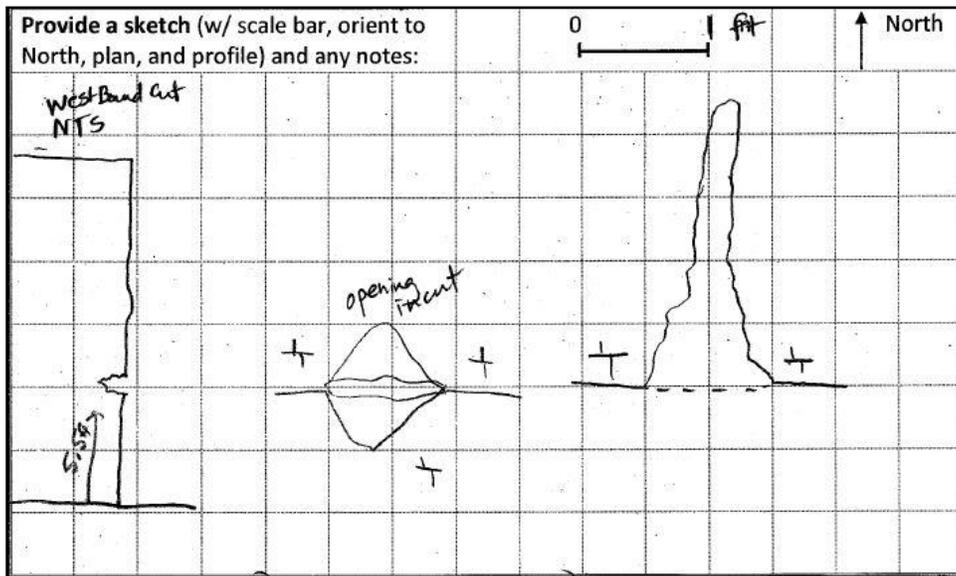

Figure 260. Field sketch of feature HB-038.

Figure 261. Overview of feature HB-038.

Figure 262. Interior of feature HB-038.

Feature JCT-26-NB (5): Solution-enlarged Fracture

This feature was located on the south side of the eastbound Loop 1604 mainlanes, west of US 281. It was encountered during utility trench excavations for the construction of the Loop 1604/US 281 interchange in 2011 (Figure 263 - Figure 266). It was a conduit formed along a fracture. Some rocks were removed from the entrance to the feature, enabling biologists to partially enter it (Figure 264) and determine that it was humanly-traversable for about 1.5 m, then it continued an unknown distance at sub-human size (Figure 265). The feature was not excavated further because potential karst invertebrate habitat suitable for sampling was present (Table 2). Biological surveys were performed on November 11, 18, and 25, 2011. Baited glue traps retrieved from this feature contained subterranean silverfish (*Texoreddellia* sp.) and an adult male eyeless spider (*Cicurina* sp., Figure 266), which was examined by taxonomist James Cokendolpher (Texas Tech University), but the lack of comparative material or a key for males of the genus kept the specimen from being identified using morphology. The original report provides details of the setting (Zara 2012a). The species in this feature and others nearby were addressed under informal consultation number 21450-2010-I-0085 when the Alamo Regional Mobility Authority constructed direct connectors for the 1604 and 281 intersection. The feature was destroyed or sealed as part of the construction process, images of the likely location are available (TxDOT 2015a); the feature was not available for 2019 surveys. In 2020, the material collected in 2011 was analyzed using mtDNA and found to align with *Cicurina puentecilla*, a non-listed species (Appendix C).

Figure 266. This eyeless adult male *Cicurina* sp. was collected on a glue trap from feature Junction 26 North B during surveys in 2011.

Feature LOOP-005: Sinkhole

This feature was located in a median south of the eastbound mainlanes of Loop 1604 and east of Judson Road (Figure 267 - Figure 269). It was evaluated on June 4, 2019. The feature was a sinkhole that measured 2.5 ft in diameter and 0.8 ft deep. This feature contained loose soil, gravel, and vegetation. Reconnaissance excavation revealed a bedrock floor. This feature was determined not to provide potential habitat for listed karst invertebrate species and no fauna surveys were performed (Table 2).

Figure 267. Overview of feature LOOP-005.

Figure 268. Close-up of feature LOOP-005.

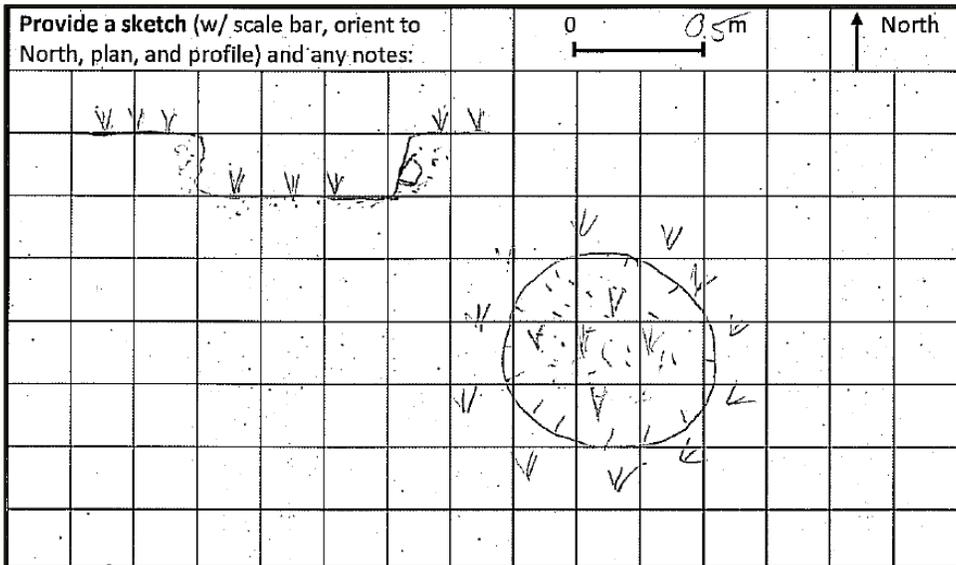

Figure 269. Field sketch of feature LOOP-005.

Feature LOOP-009: Solution Cavity

This feature was located in the roadcut north of the westbound mainlanes of Loop 1604 east of Highway 281 (Figure 270 - Figure 273). A feature evaluation was performed on June 17, 2019. This 0.8 m (2.6 ft) wide and 0.98 m (3.2 ft) wide solution cavity was bisected by the roadcut. It extended downward for 1.1 m (3.6 ft) and had a floor depth of approximately 1.98 m (6.5 ft) below the original land surface. In June 2019, 2.25 person hours were spent removing 1.6 m³ (56 ft³) of material using hand tools. Mesocavernous drains continued downwards, with no noticeable airflow. This feature contained rocks, cobbles, and bedrock.

Feature LOOP-009 was considered potential karst invertebrate habitat due to void size greater than or equal to 1 m (3.3 ft) and presence of mesocavernous voids (Table 2). Presence/absence surveys were conducted in July 2019 (Table 36); notable fauna are summarized in Table 1 and Table 37. Troglotic species recorded from this feature include *Brackenridgia* sp. No listed species were observed or collected.

Moth	Lepidoptera
Fly / Gnat	Diptera

Feature LOOP-010: Solution Cavity

This feature was located in the roadcut north of the westbound mainlanes of Loop 1604, east of Highway 281 (Figure 274 - Figure 278). The feature was evaluated on June 17, 2019. This 1.5 m (4.9 ft) wide, 1.4 m (4.5 ft) long, 1.2 m (3.9 ft) high solution cavity was bisected by the roadcut and was 2.4 m (7.8 ft) below the original land surface. This feature contained fine, compact, reddish sediment. A void extending 0.4 m (1.3 ft) into the feature was discovered after recon excavation was performed. On June 25, 2019, 3 person-hours were spent removing 0.25 m³ (8.8 ft³) of material using hand tools. A distinct terminus was reached when the back wall of the feature was visible (Figure 278). No airflow or fauna were observed. This feature was determined not to provide potential habitat for listed karst invertebrate species and no fauna surveys were performed (Table 2).

Feature LOOP-011: Plugged Feature

This feature was located on the north side of the eastbound mainlanes of Loop 1604, west of Gold Canyon Road (Figure 279 - Figure 280). It was an apparent karst feature that was presumably plugged with grout under the 281/1604 interchange WPAP. Due to this plug, it could not be assessed.

Figure 279. Overview of feature LOOP-011.

Figure 280. Close-up of feature LOOP-011, showing grout plug.

Feature LOOP-102 (Fiesta Cave); Paleospring

This feature was located in a cliff along a streambed west of the southbound mainlanes of I-10 north of Loop 1604 (Figure 281 - Figure 283). A feature evaluation was performed on May 31, 2019 and July 8, 2019. The feature was a paleospring that measured 4.0 m (13.1 ft) wide by 3.0 m (9.8 ft) long and 0.49 m (1.6 ft) high. The feature was humanly enterable and had mesocavernous voids. This feature contained rocks, cobbles, and fine, tan clay sediment. The feature was reported as Fiesta Cave from the TSS database.

Feature LOOP-102 was considered potential karst invertebrate habitat due to length, an enterable void, and modern soil (Table 2). Presence/absence surveys were conducted in July and August 2019 (Table 38); notable fauna are summarized in Table 1. Troglotic species recorded from this feature include *Brackenridgia* sp. No listed species were observed or collected.

Feature LOOP-103: Solution Cavity

This feature was located in an exposed cliff along Leon Creek, west of the southbound mainlanes of I-10 north of Loop 1604 (Figure 284 - Figure 286). Feature evaluations were performed on May 31 and August 27, 2019. The feature was a non-enterable solution cavity that measured 0.4 m (1.3 ft) wide by 2 m (6.5 ft) long and 0.4 m (1.3 ft) high. Excavation was conducted on August 27, 2019, removing some silt from the floor. Due to its length and the presence of a mesocavernous void at the back, it was considered to be potential karst invertebrate habitat (Table 2). Presence/absence surveys were performed in August and September 2019 (Table 40); however, no troglobites were found (Table 1, Table 41).

[Feature LOOP-104: Other, Flowing seep/sewage leak](#)

This feature was located east of the northbound mainlanes of I-10, south of Loop 1604 (Figure 287 - Figure 289). It was evaluated on June 4, 2019. The feature was a non-enterable spring or sewage leak approximately 0.9 m (3 ft) wide and 0.01 m (0.02 ft) high with an unknown length extending underneath concrete. This feature had no mesocavernous voids and contained soft loose soil and vegetation which had a foul odor when disturbed. This feature was determined not to provide potential habitat for listed karst invertebrate species and no fauna surveys were performed (Table 2).

Figure 289. Close-up of feature LOOP-104.

Feature LOOP-105: Solution Cavity

This feature was in an exposed road cut west of the southbound mainlanes of I-10, north of Loop 1604 (Figure 290 - Figure 293). It was evaluated on June 6, 2019. The feature was a non-enterable solution cavity that measured 0.4 m (1.3 ft) wide by 1.2 m (4.1 ft) long and 0.4 m (1.3 ft) high. The feature had no airflow and no mesocavernous voids. It was approximately 5.0 m (16.4 ft) below the original land surface. This feature contained cobble-sized rocks. This feature was determined not to provide potential habitat for listed karst invertebrate species and no fauna surveys were performed (Table 2).

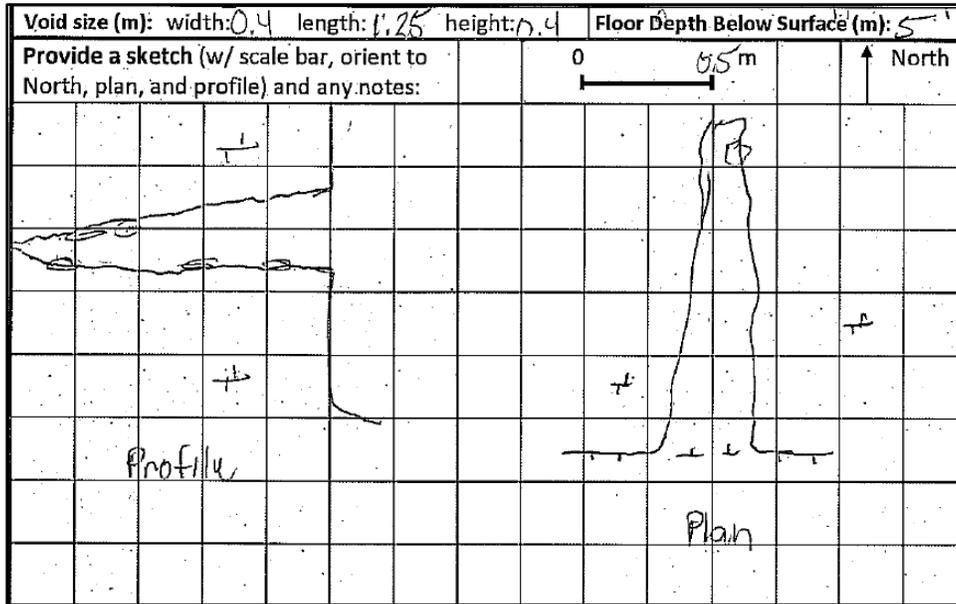

Figure 290. Field sketch of feature LOOP-105.

Figure 291. Overview of feature LOOP-105.

Figure 293. View to the north from feature LOOP-105.

Feature LOOP-107; Solution-enlarged bedding plane

This feature was located in a roadcut north of the westbound mainlanes of Loop 1604, east of US 281 North (Figure 294 - Figure 296). It was evaluated on July 24, 2019. This solution-enlarged bedding plane was 1.5 m (4.9 ft) wide by 0.2 m (0.65 ft) long by 0.2 m (0.7 ft) tall. This feature was non-enterable with no airflow and no mesocavernous voids. The feature contained only exposed bedrock and some calcite. This feature was determined not to provide potential habitat for listed karst invertebrate species and no fauna surveys were performed (Table 2).

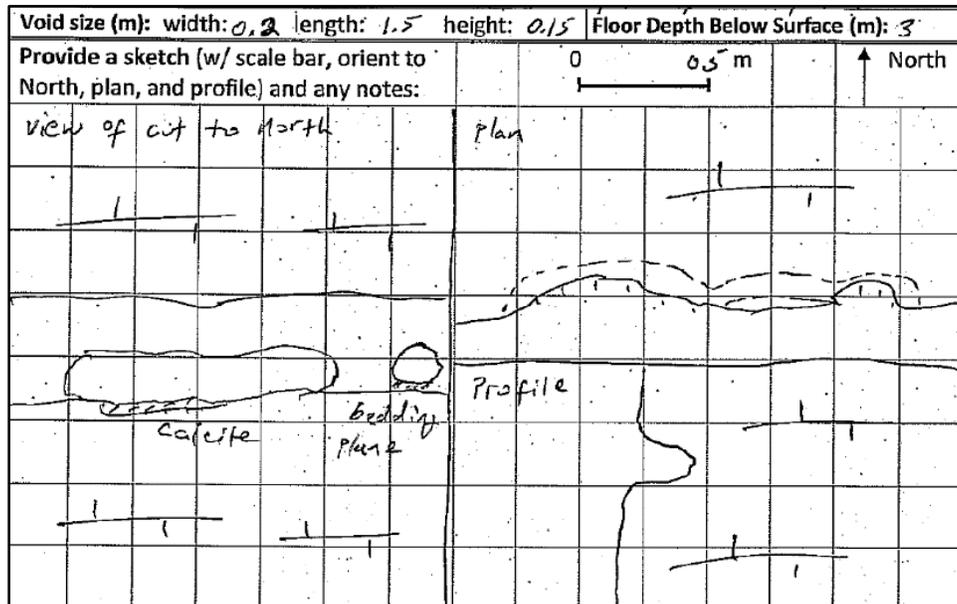

Figure 294. Field sketch of feature LOOP-107.

Figure 295. Overview of feature LOOP-107.

Figure 296. Close-up of feature LOOP-107.

Feature LOOP-110: Solution Cavity

This feature was located in a roadcut south of the eastbound mainlanes of Loop 1604, east of Gold Canyon (Figure 297 - Figure 299). This feature was evaluated on July 24, 2019. This solution cavity was 0.50 m (1.6 ft) wide by 0.50 m (1.6 ft) long by 0.7 m (2.3 ft) tall. This feature contained exposed bedrock, calcite surfaces, and some gravel-sized rocks. There was no airflow and no fauna were observed, and it was found to definitively end. This feature was determined not to provide potential habitat for listed karst invertebrate species and no fauna surveys were performed (Table 2).

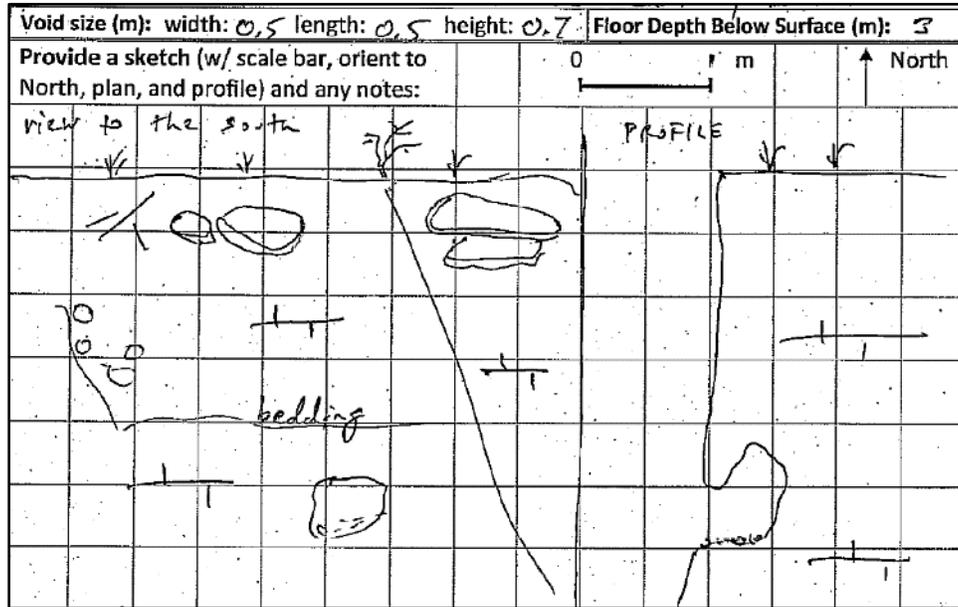

Figure 297. Field sketch of feature LOOP-110.

Figure 298. Overview of feature LOOP-110.

Figure 299. Close-up of entrance to feature LOOP-110, with ruler for reference.

Feature LOOP-111; Solution Cavity

This feature was located in a roadcut south of the eastbound mainlanes of Loop 1604, west of Gold Canyon Road (Figure 300 - Figure 302). It was evaluated on July 24, 2019. This solution cavity was 0.3 m (1.0 ft) wide by 0.3 m (1.0 ft) long by 1.0 m (3.3 ft) tall (Figure 300 - Figure 302). It contained exposed bedrock with orange staining, gravel-sized rocks, and some grass. This feature was determined not to provide potential habitat for listed karst invertebrate species and no fauna surveys were performed (Table 2).

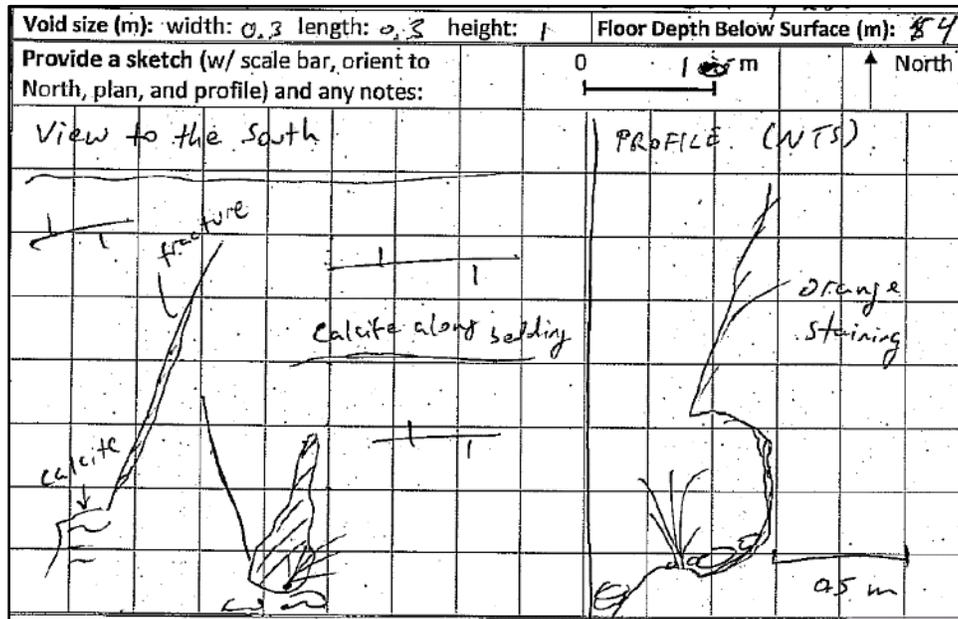

Figure 300. Field sketch of feature LOOP-111.

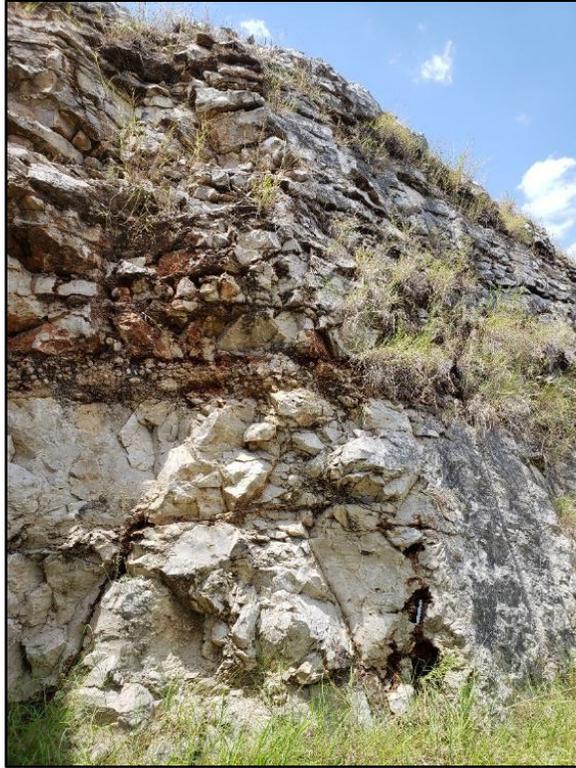

Figure 301. Overview of feature LOOP-111.

Figure 302. Close-up of feature LOOP-111, with a ruler for reference.

Feature LOOP-112: Solution Cavity

This feature was located in a roadcut south of the eastbound mainlanes of Loop 1604 to the west of Gold Canyon Road (Figure 303 - Figure 305). It was evaluated on July 24, 2019. This solution cavity was 0.3 m (1.0 ft) wide by 0.3 m (1.0 ft) long by 0.2 m (0.7 ft) tall (Figure 303 - Figure 305). This feature contained exposed bedrock, calcite surfaces, and gravel-sized rocks. This feature was determined not to provide potential habitat for listed karst invertebrate species and no fauna surveys were performed (Table 2).

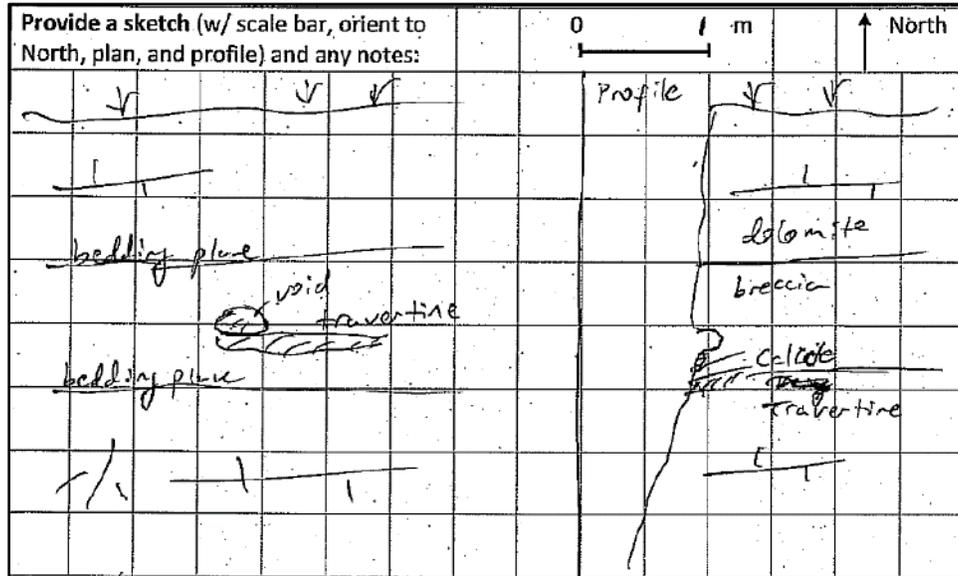

Figure 303. Field sketch of feature LOOP-112.

Figure 304. Overview of feature LOOP-112.

Figure 305. Close-up of feature LOOP-112.

Feature LOOP-202; Sinkhole

This feature was located in a streambed under the westbound access road of Loop 1604, southwest of Kyle Seale Parkway (Figure 306 - Figure 309). The feature was evaluated on June 7, 2019 and determined that further excavation was needed. Excavation was performed on June 19, 2019, and 0.5 person hours were spent removing 0.03 m³ (0.3 ft³) of material using hand tools. A distinct terminus was reached at the end of day. The feature was a non-enterable sinkhole that measured 0.5 m (1.6 ft) long by 0.2 m (0.7 ft) wide and 0.3 m (1.0 ft) deep with no noticeable airflow and no mesocavernous voids. This feature contained rocks, cobbles, fine loose sediment, and leaf litter. This feature was determined not to provide potential habitat for listed karst invertebrate species and no fauna surveys were performed (Table 2).

Feature LOOP-204; Solution-enlarged Fracture

This feature was located south of the eastbound mainlanes of Loop 1604 west of Stone Oak Parkway within a drainage (Figure 310 - Figure 312). It was evaluated on July 16, 2019. The feature was a solution-enlarged fracture that measured 1.5 m (5 ft) wide by 2.4 m (8 ft) across, and 0.1 m (0.4) ft deep, had no airflow and no mesocavernous voids. Minimal excavation was performed using hand tools. This feature was filled with coarse rocks, cobbles, compact soils, calcite, and bedrock. This feature was determined not to provide potential habitat for listed karst invertebrate species and no fauna surveys were performed (Table 2).

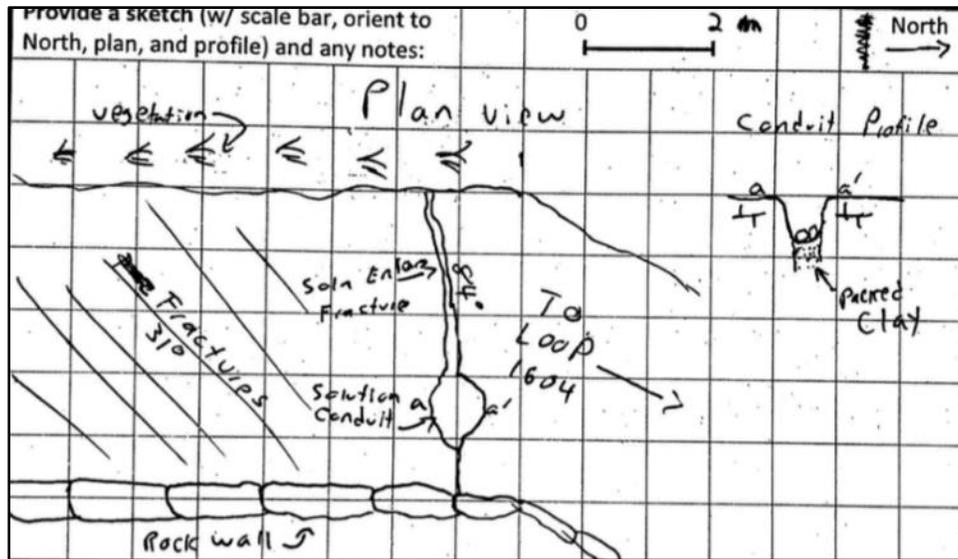

Figure 310. Field sketch of feature LOOP-204.

Figure 311. Overview of feature LOOP-204.

Figure 312. Close-up of feature LOOP-204.

Feature LOOP-207; Solution Cavity/Solution-enlarged Fracture

This feature was located in a streambed on an easement west of the southbound lanes of I-10, north of Loop 1604 (Figure 313 - Figure 315). The feature was evaluated on July 23, 2019. It was a solution cavity that measured 0.8 m (2.5 ft) wide by 1.8 m (6 ft) long and 0.3 m (1 ft) deep. The solution cavity was exposed at the base of a cliff, 9.5 m (31 ft) below the top of the cliff. The feature had no airflow and no human-sized void. The feature had mesocavernous voids and was filled with loose soils, leaf litter, cobbles, and fine sediment. No excavation was performed.

Feature LOOP-207 was considered potential karst invertebrate habitat due to development along a fracture, void length greater than 1 m (3.3 ft) that continued (Table 2). Presence/absence surveys were conducted in July and August 2019 (Table 42); however, no troglobites were found (Table 1, Table 43).

Feature LOOP-213: Solution Cavity/Solution-enlarged Fracture

This feature was located south of the eastbound mainlanes of Loop 1604, east of Babcock Road (Figure 316 - Figure 318). It was evaluated on July 24, 2019. The feature was a solution-enlarged fracture that measured 0.9 (3 ft) wide by 0.9 (3 ft) long and 0.06 (0.2 ft) deep, with a maximum aperture of 0.1 m (0.3 ft). This feature was filled with loose soils, leaf litter, vegetation, and bedrock. Due to the presence of a downward void, it was excavated on July 29, 2019, and 0.2 m³ (2 ft³) of material was removed. Excavation was halted when a red clay plug was encountered. This feature was determined not to provide potential habitat for listed karst invertebrate species and no fauna surveys were performed (Table 2).

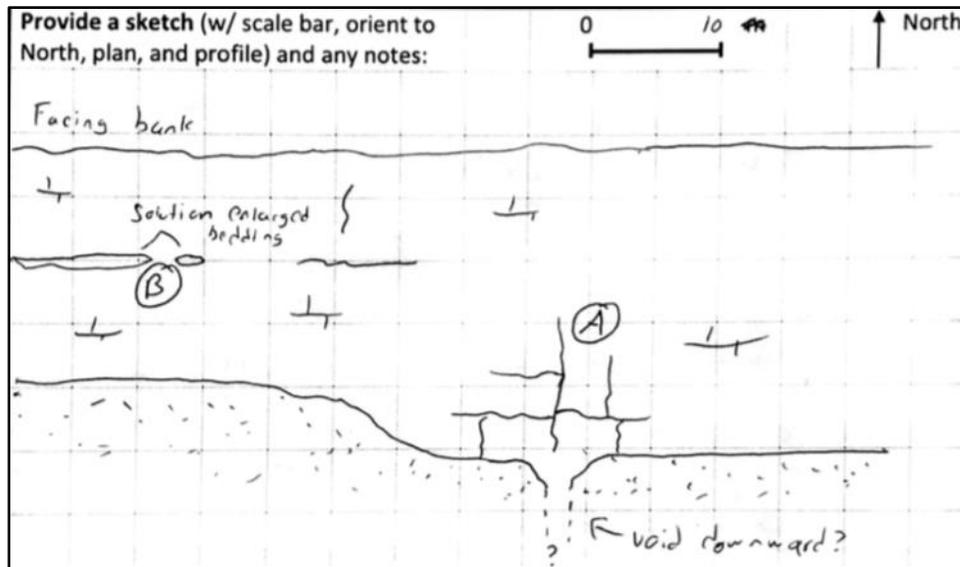

Figure 316. Field sketch of feature LOOP-213.

Figure 317. Overview of feature LOOP-213.

Figure 318. Interior of enlarged bedding plane at feature LOOP-213.

Feature LOOP-214: Solution Cavity/Solution-enlarged Fracture

This feature was located south of the eastbound mainlanes of Loop 1604 and west of West Bitters Road (Figure 319 - Figure 323). It was evaluated on July 25, 2019. The feature was a zone of solution-enlarged fractures and solution cavities within a streambed that measured 9.1 m (30 ft) wide by 54.9 m (180 ft) long and 0.6 (2 ft) deep. There was no airflow, no mesocavernous voids, and no human-sized void. This feature was filled with fine compact soils, calcite, and bedrock. Excavation was not warranted because the feature was nearly entirely bedrock with very little loose debris available to move. This feature was determined not to provide potential habitat for listed karst invertebrate species and no fauna surveys were performed (Table 2).

Figure 321. Fracture in bedrock on feature LOOP-214.

Figure 322. Solution cavities in bedrock on feature LOOP-214.

Figure 323. Solution-enlarged fracture in bedrock of feature LOOP-214.

Feature LOOP-215: Solution Cavity/Solution-enlarged Fracture

This feature was located on a natural cliff face of Leon Creek, west of the southbound lanes of I-10 and south of La Cantera Road (Figure 324 - Figure 327). The feature was evaluated on July 23, 2019 and August 5, 2019. It was a solution-enlarged fracture with no airflow that measured 1.2 m (1.2 ft) wide by 1.9 m (6.0 ft) long and 0.8 m (2.6 ft) tall. This feature had a floor depth of 3.0 m (9.8 ft) below the top of the cliff, and the entrance was approximately 4.0 m (13.1 ft) above the base of the cliff. The floor consisted of loose soil, rocks, and bedrock. The interior of the feature was bedrock and no excavation was performed. The feature was similar to other features in the area and had mesocavernous voids.

Feature LOOP-215 was considered potential karst invertebrate habitat due to similarity to nearby caves, void size greater than or equal to 1.0 m (3.3 ft), and modern soils and leaf litter (Table 2). Presence/absence surveys were conducted in August and September 2019 (Table 44); however, no troglobites were found (Table 1, Table 45).

[Feature LOOP-217; Solution Cavity/Solution-enlarged Bedding Plane](#)

This feature was located in a roadcut south of the eastbound mainlanes of Loop 1604, west of Blanco Road (Figure 328 - Figure 330). This feature was found on September 25, 2019. The surface expression of this feature was very subtle and was detected only because surveyors could discern that water had flowed into the drilled shaft at the base of the roadcut. The feature itself was a solution cavity or solution-enlarged bedding plane located at the bottom of the drill hole that was made during the original construction of Loop 1604. The feature was situated approximately 1 m (3.3 ft) below the grade and was visible only by looking down the drilled hole. Excavation was concluded on September 30, 2019 removing loose rocks and soil until bedrock was encountered. No mesocavernous voids continued into bedrock, and the natural part of the feature below the drill hole was less than 1 m in length, so it was not considered to contain karst invertebrate habitat (Table 2).

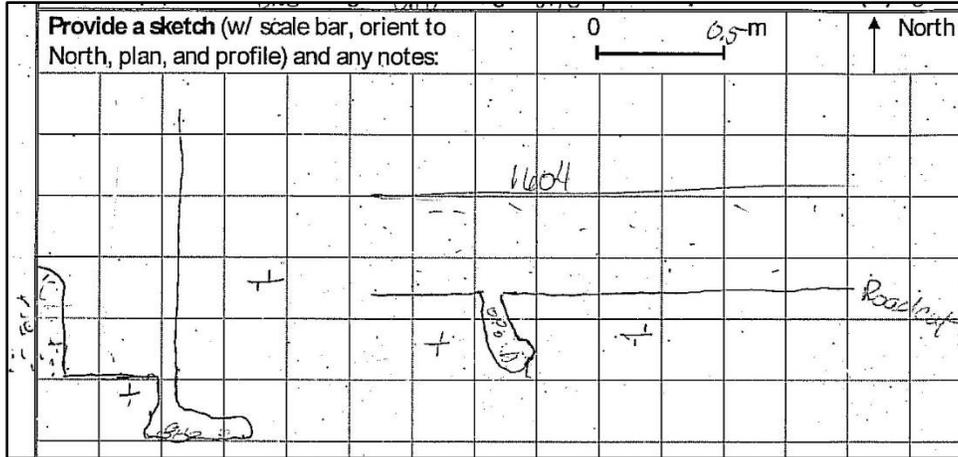

Figure 328. Field sketch of feature LOOP-217.

Figure 330. Close-up of feature LOOP-217.

Discussion

In the 1535 ac Project Area 48 new features were found, and most of those were in the easements which have had less study. Previously studied sites were re-surveyed to meet the current protocol requirements of 14 surveys. In most cases, new records were found, such as *Cicurina platypus/bullis* from feature 1604-FZ7 and a *Cambala* sp. millipede from feature 1604-L16 (12A Cave). In at least one case, there were no new records for troglobites (1604-R06). Green Mountain Road Cave, which previously had five biological surveys, was also re-surveyed. This current effort yielded new records including what is likely the troglobitic spider, *Eidmannella* sp., and a range extension for a troglobitic schizomid.

Some locations did not meet the criteria for habitat in the 2009 and 2010 assessments, but the slightly changed current criteria put a few locations over that threshold, so they were sampled during this effort. Examples include 1604-FZ4, 1604-R05. In both instances, presence/absence surveys revealed no troglobites.

While surveys did not yield any new localities for listed species, three previously known sites occur in the Action Area, including Green Mountain Road Cave (1604-E09), La Cantera Cave No. 1, and La Cantera Cave No. 2 (Table 1, Figure 2). Critical Habitat Unit 9 also overlaps with the Action Area, however the occupied caves and features in that unit do not occur in the Action Area. The only occupied site that occurs in the Project Area is Green Mountain Road Cave (1604-E09).

Appendix A. Non-habitat Features and Features Not Evaluated

Table A-1. GA-only Features, and

Table A-2. Historic, Destroyed, Not Found, Not Evaluated Features

Table A-1. Summary table of features in the Project Area that are mentioned in the GA performed concurrently with the current study but are not considered potential karst invertebrate habitat.

Feature ID	Feature type	Latitude (NAD 83)	Longitude (NAD83)
1604-002	Non-karst closed depression	29.60178	-98.39433
1604-F057	Fracture zone in creekbed/bedrock scour	29.60151	-98.53895
1604-T01	Solution cavity/bisected roadcut sinkhole	29.60559	-98.45509
1604-T02	Solution cavity/bisected roadcut sinkhole	29.6057	-98.45572
1604-T04	Bisected roadcut sinkhole	29.607994	-98.525234
1604-T05	Fault	29.603564	-98.534041
1604-T06	Solution cavity/bisected roadcut sinkhole	29.602691	-98.534679
1604-T07	Fault	29.602761	-98.534457
1604-T08	Solution-enlarged fracture zone	29.602843	-98.53414
1604-T09	Bisected roadcut sinkhole	29.602991	-98.533825
1604-T11	Bisected roadcut sinkhole	29.605028	-98.530001
1604-T12	Solution-enlarged bedding plane/ bisected roadcut sinkhole	29.607441	-98.525634
1604-T17	Mapped Fault	29.6026	-98.3813
1604-T18	Mapped Fault	29.6025	-98.3857
1604-T22	Mapped Fault	29.6009	-98.4189
1604-T25	Mapped Fault	29.5991	-98.5651
1604-T27	Mapped Fault	29.592	-98.5881
1604-T34	Mapped Fault	29.5464	-98.674
1604-W05	Zone of karst	29.608466	-98.523442
1604-W08	Zone of karst	29.603074	-98.533352
F056	Enlarged fracture in streambed	29.6029	-98.539
G01	Non-karst closed depression	29.592528	-98.597487
G14	Fault	29.614088	-98.605183
HB-012	Bisected roadcut sinkhole	29.603786	-98.533114
HB-017	Bisected roadcut sinkhole	29.603008	-98.535008

Table A-1. (Continued) Summary table of features in the Project Area that are mentioned in the GA performed concurrently with the current study but are not considered potential karst invertebrate habitat.

Feature ID	Feature type	Latitude (NAD 83)	Longitude (NAD83)
HB-025	Bisected roadcut sinkhole	29.602464	-98.535399
LOOP-001	Fractured bedrock	29.60124	-98.40352
LOOP-002	Fractured bedrock	29.60341	-98.53891
LOOP-003	Zone of fractures in creek bed	29.56273	-98.65813
LOOP-004	Void in fill	29.60163	-98.38293
LOOP-006	Vuggy bedrock	29.60151	-98.39114
LOOP-007	Fractured bedrock	29.60203	-98.39027
LOOP-008	Geotech borehole	29.60178	-98.40454
LOOP-012	Fractured bedrock/sinking stream	29.60986	-98.48728
LOOP-013	Fractured bedrock	29.61021	-98.48101
LOOP-014	Fractured bedrock	29.60921	-98.51984
LOOP-015	Fractured bedrock	29.60717	-98.52825
LOOP-016	Fractured bedrock	29.60781	-98.51811
LOOP-017	Fractured bedrock	29.6077	-98.51674
LOOP-101	Non-karst closed depression	29.59939	-98.59891
LOOP-106	Fractured bedrock	29.60139	-98.39579
LOOP-108	Enlarged fracture	29.60579	-98.456
LOOP-109	Enlarged fracture	29.60573	-98.45537
LOOP-113	Fractured bedrock	29.60793	-98.50007
LOOP-114	Fractured bedrock	29.60777	-98.49595
LOOP-115	Fractured bedrock	29.60849	-98.48663
LOOP-116	Vuggy bedrock	29.60893	-98.48083
LOOP-201	Geotech borehole	29.55824	-98.66204
LOOP-203	Enlarged fracture	29.60913	-98.496
LOOP-205, F092	Fractured bedrock/sinking stream	29.60862	-98.48667
LOOP-208	Enlarged fracture and contact	29.61892	-98.60857

Table A-1. (Continued) Summary table of features in the Project Area that are mentioned in the GA performed concurrently with the current study but are not considered potential karst invertebrate habitat.

Feature ID	Feature type	Latitude (NAD 83)	Longitude (NAD83)
LOOP-209	Enlarged fracture	29.58197	-98.64213
LOOP-211	Well or test hole	29.57528	-98.64575
LOOP-212	Enlarged fracture	29.57942	-98.64146
LOOP-216	Fault	29.60887	-98.51072
North Wall C(33)	Solution cavity	29.606639	-98.458194
RB-008	Well	29.599748	-98.42524
RB-009	Non-karst closed depression	29.599683	-98.427468
RB-010	Non-karst closed depression	29.599593	-98.430772
RB-013	Non-karst closed depression	29.599944	-98.426155

Table A-2. Features that are historic, destroyed, not found, or otherwise not described. Historic features are primarily gathered during literature review of former Geologic Assessments, and those are cited as the source. Features not found were either in the Project Area and specifically searched for and not found, or outside of the Project Area where surveyors did not visit.

Feature ID	Latitude (NAD 83)	Longitude (NAD83)	Current Status and Comments	Source	In Project Area	In Action Area Only
34	29.589442	-98.616792		TSS 2019	x	
43746	29.592	-98.5967	not found	TSS	x	
04WB 21/22	29.61051	-98.47786	Not found in 2019, destroyed. Void with habitat in a trench for a ramp footing - 3 p/a surveys done; no listed spp. Found.	Zara 2012a	x	
04-WB-30(10)	29.6105	-98.477667	Not found in 2019, destroyed. Solution cavity with habitat in a trench for ramp footing - 3 p/a surveys done; no listed spp. Found	Zara 2012a	x	
1604-001	29.60173	-98.39302	Non-karst closed depression	TSS 2019	x	
1604-039	29.60103	-98.40665	Undetermined - access for excavation not granted in 2009, not found in 2015; outside of ROW	TxDOT 2015a	x	
1604-901	29.60649	-98.4596	Not habitat in 2010, not reported in 2019	TxDOT 2015a	x	
1604-BC28	29.58816	-98.6272	Not found in 2019, sewer line in creek - manmade feature	TxDOT 2015a	x	
1604-CE2	29.59086	-98.60202	Not found, see feature description in Zara 2019	TxDOT 2015a	x	
1604-D04	29.60834	-98.51379	Not found in 2019, likely was animal burrow, historic	TxDOT 2015a	x	
1604-D14	29.60826	-98.52278	Not found in 2019, not found in Zara 2017 GA. See TxDOT 2015a.	TxDOT 2015a	x	
1604-D21	29.60259	-98.36423	Exposed bedrock/non-karst closed depression	TSS 2019	x	
1604-E02	29.60812	-98.50642	Not found in 2019, utility trench	TxDOT 2015a	x	
1604-E06	29.60845	-98.46796	Not found in 2019, utility trench subsidence in 2010	TxDOT 2015a	x	
1604-E08	29.60766	-98.46423	Not found in 2019, non-karst closed depression	TxDOT 2015a	x	

Table A-2. (Continued) Features that are historic, destroyed, not found, or otherwise not described. Historic features are primarily gathered during literature review of former Geologic Assessments, and those are cited as the source. Features not found were either in the Project Area and specifically searched for and not found, or outside of the Project Area where surveyors did not visit.

Feature ID	Latitude (NAD 83)	Longitude (NAD83)	Current Status and Comments	Source	In Project Area	In Action Area Only
1604-F097	29.60714	-98.46152	Not habitat in 2009, not located in 2015, probably mined away during 1604/281 interchange construction	TxDOT 2015a	x	
1604-F098	29.60692	-98.46077	Not habitat in 2009, not located in 2015, probably mined away during 1604/281 interchange construction	TxDOT 2015a	x	
1604-F099	29.60679	-98.46038	Enlarged bedding plane with P/A surveys in 2009 (trogllobites but no ES found), destroyed for 281/1604 interchange: see TxDOT 2015	TxDOT 2015a	x	
1604-F101 (Tally Ho Cave)	29.60644	-98.45923	Cave in 2009, had P/A surveys in 2009 (trogllobites incl. <i>Cicurina platypus</i> found but no endangered species found), destroyed for 281/1604 interchange: see TxDOT 2015	TxDOT 2015a	x	
1604-F102	29.60673	-98.45863	Enlarged fracture destroyed for 281/1604 interchange: see TxDOT 2015	TxDOT 2015a	x	
1604-F103	29.60667	-98.45843	Enlarged fracture destroyed for 281/1604 interchange: see TxDOT 2015	TxDOT 2015a	x	
1604-FZ2	29.607	-98.45955	Enlarged Fracture in 2009, had P/A surveys in 2009 (no ES found), destroyed for 281/1604 interchange: see TxDOT 2015	TxDOT 2015a	x	
1604-K40	29.60549	-98.45633	Not found in 2019, found in 2009 at base of the roadcut, probably filled with debris.	TxDOT 2015a	x	
1604-L08	29.60265	-98.54061	Stream scour	TSS 2019	x	
1604-M33	29.6016	-98.53948	Manmade feature (gas line)	TxDOT 2015a	x	
1604-M39	29.60128	-98.548	Not found in 2019, non-karst closed depression in 2015	TxDOT 2015a	x

Table A-2. (Continued) Features that are historic, destroyed, not found, or otherwise not described. Historic features are primarily gathered during literature review of former GAs, and those are cited as the source. Features not found were either in the Project Area and specifically searched for and not found, or outside of the Project Area where surveyors did not visit.

Feature ID	Latitude (NAD 83)	Longitude (NAD83)	Current Status and Comments	Source	In Project Area	In Action Area Only
S-6	29.5972	-98.5725	no access - not located	Pape-Dawson, 2008 (B)		x

Appendix C. Genetic determination report

Provided as a separate attachment.

Cicurina Species Identification Report to Zara and TxDOT

Caleb D. Phillips, caleb.phillips@ttu.edu, phone: 806-834-8181

January 21, 2020

This is a report of molecular species identification of one *Cicurina* specimen provided to Caleb D. Phillips.

Specimens examined

TK 188518; Zara 6789; Feature JCT-26-NB (5): USA: TX: Bexar Co; -98.48860; 29.60897; 18 November 2011; Jeanette Larsen; Hicks 1604/281 interchange project

Methods

A portion of the mitochondria Cytochrome C Oxidase Subunit I gene was amplified and sequenced using primers developed in-house by Caleb Philips based on the mitochondrial genome sequence provided by Parlos et al (in prep). All reaction conditions were similar to those in Parlos et al. (in prep). Digital sequence data was compared to a database of *Cicurina* COI sequences available at GenBank through accession numbers KU552214-KU552333. Pairwise genetic distance of each specimen was compared to each database specimen. Analysis employed the Kimura 2-parameter model of molecular evolution and uniform rates of mutation among sites. Resulting pairwise genetic distance matrix was parsed and visualized using custom R code.

Results

Total Number of Base Pairs Compared: 1083

Number of variable sites: 353

Number of Parsimony Informative Sites: 289

Number of Singleton Sites: 64

Based on the results of analysis the following species identifications are provided.

Zara6789: *Cicurina puentecilla*

Figures

Figure(s) provided below illustrate genetic divergence of specimens examined in this report relative to database entries. Each comparison is colored according to the species identification of each database entry. Instances in which a county name rather than a species name is provided reflect specimens examined by Parlos et al. (in prep), for which species status is currently unknown.

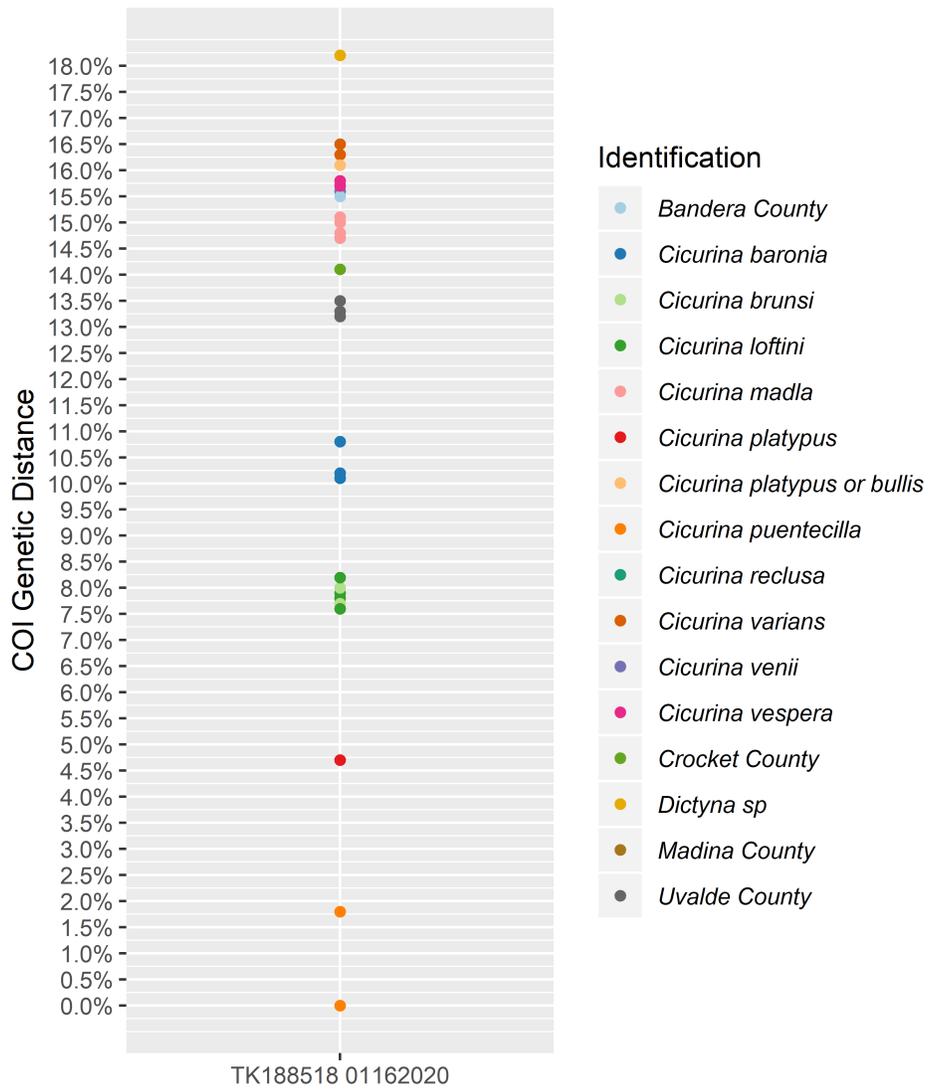

Figure 1: Comparison of specimen TK188518/Zara6789 to all database entries.

Cicurina Species Identification Report to Zara and TxDOT

Caleb D. Phillips, caleb.phillips@ttu.edu, phone: 806-834-8181

September 19, 2019

This is a report of molecular species identification of one *Cicurina* specimen provided to Caleb D. Phillips.

Specimens examined

Zara12517 from location 1604-FZ7 (Coordinates: 29.608061, -98.525249)

Methods

A portion of the mitochondria Cytochrome C Oxidase Subunit I gene was amplified and sequenced using primers developed in-house by Caleb Phillips based on the mitochondrial genome sequence provided by Parlos et al (in prep). All reaction conditions were similar to those in Parlos et al. (in prep). Digital sequence data was compared to a database of *Cicurina* COI sequences available at GenBank through accession numbers KU552214-KU552333. Pairwise genetic distance of each specimen was compared to each database specimen. Analysis employed the Kimura 2-parameter model of molecular evolution and uniform rates of mutation among sites. Resulting pairwise genetic distance matrix was parsed and visualized using custom R code.

Results

Total Number of Base Pairs Compared: 1083

Number of variable sites: 353

Number of Parsimony Informative Sites: 299

Number of Singleton Sites: 54

Based on the results of analysis the following species identifications are provided.

Zara12517: *Cicurina platypus/bullis*

Figures

Figure(s) provided below illustrate genetic divergence of specimens examined in this report relative to database entries. Each comparison is colored according to the species identification of each database entry. Instances in which a county name rather than a species name is provided reflect specimens examined by Parlos et al. (in prep), for which species status is currently unknown.

On Tuesday, October 8, 2019, 3:01:32 PM CDT, Oscar Federico Francke B <offb@ib.unam.mx> wrote:

Howdy Peter:

Rodrigo had a chance to check the shizos you sent in the last package.

The protoschizomid from Texas is a new *Agastoschizomus* without a doubt. Rodrigo has to try to dissect the spermatheca to determine if it is an adult female or not. However, the flagellum is missing and without it he is very hesitant to describe it. Perhaps the flagellum broke when then removed the specimen from the sticky trap. If they are going to sample that cave again, with sticky traps again, please tell them to be very carefull not to leave the flagellum behind! Even if it breaks off, putting it in the vial with a note to that effect would be of great help!

The two specimens from QR are a new species of *Troglostenochrus*! Before we only had females and it was thought to be perhaps a *Mayazomus*, but this time you guys caught an adult male (finally!) and there is no doubt about its identity. The only two known species in that genus are from caves in Chiapas and in Guerrero!! What a biogeographic puzzle!

Cheers,

Oscar

- Presence/absence survey conducted; No endangered species detected
- Not karst invertebrate habitat
- Historic, destroyed, not found, not evaluated, GA-only

Karst Zones

- 1: Known to contain endangered species
- 2: High probability for endangered species
- 3: Probably do not contain endangered species
- 4: Requires further research
- 5: Does not contain endangered species

- Project Area
- Action Area
- Critical Habitat Unit
- Streams

Basemap: ESRI 2020; Critical Habitat Units: USFWS 2012; Karst Zones: George Veni Associates 2003; Streams: TCEQ 2000.

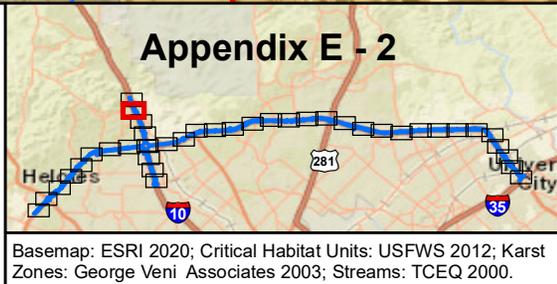

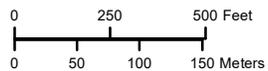

Features

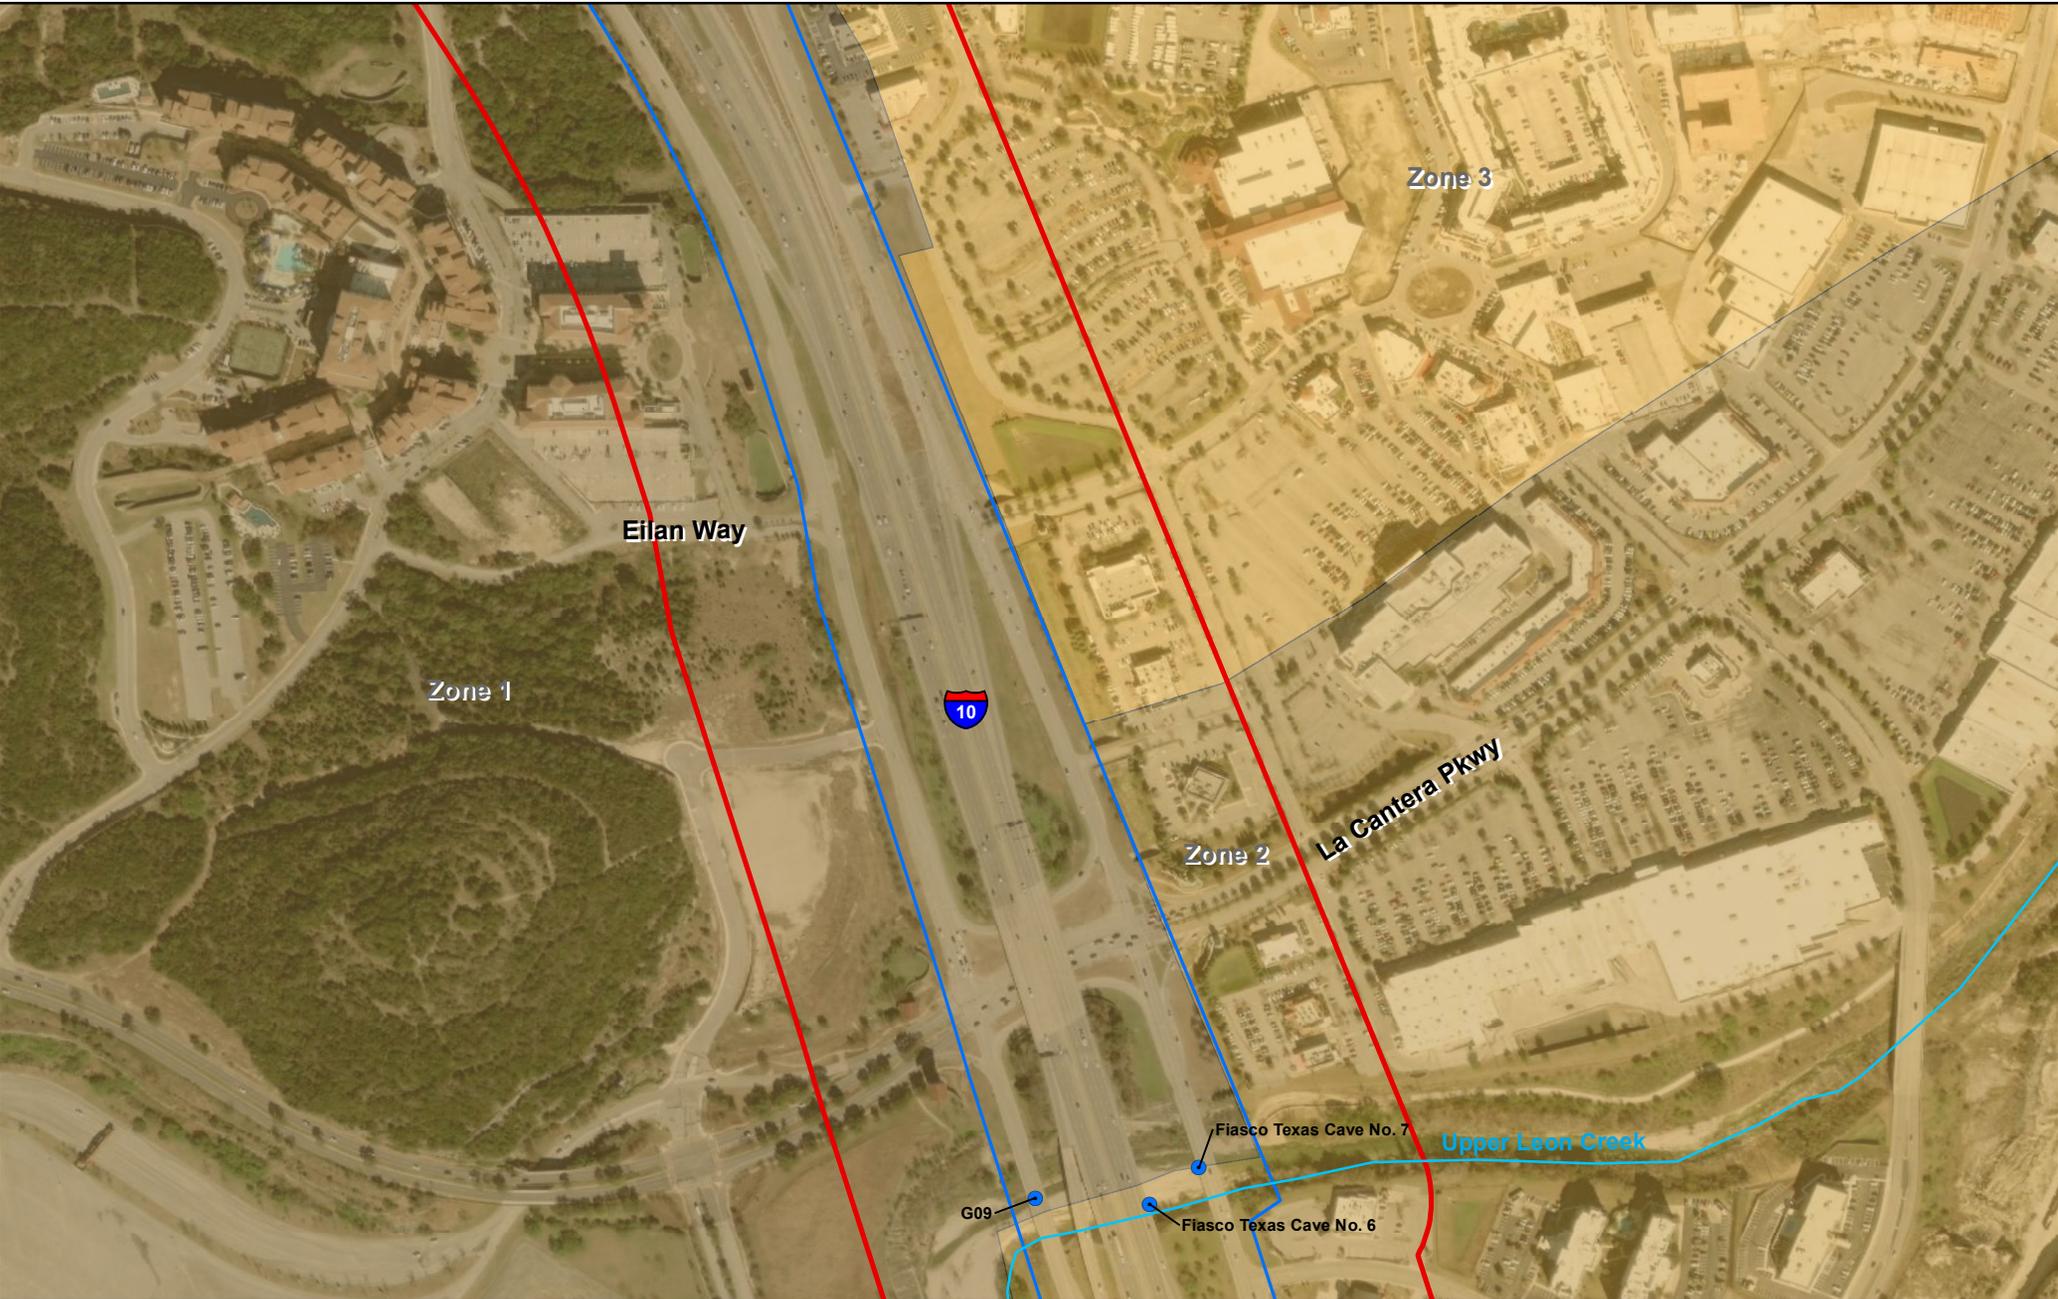

- ★ Endangered species present
- Presence/absence survey conducted; No endangered species detected
- Not karst invertebrate habitat
- Historic, destroyed, not found, not evaluated, GA-only

Karst Zones

- 1: Known to contain endangered species
- 2: High probability for endangered species
- 3: Probably do not contain endangered species
- 4: Requires further research
- 5: Does not contain endangered species

- Project Area
- Action Area
- Critical Habitat Unit
- Streams

Appendix E - 30

Basemap: ESRI 2020; Critical Habitat Units: USFWS 2012; Karst Zones: George Veni Associates 2003; Streams: TCEQ 2000.

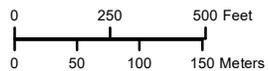

Features

- ★ Endangered species present
- Presence/absence survey conducted; No endangered species detected
- Not karst invertebrate habitat
- Historic, destroyed, not found, not evaluated, GA-only

Karst Zones

- 1: Known to contain endangered species
- 2: High probability for endangered species
- 3: Probably do not contain endangered species
- 4: Requires further research
- 5: Does not contain endangered species

- Project Area
- Action Area
- Critical Habitat Unit
- Streams

Appendix E - 31

Basemap: ESRI 2020; Critical Habitat Units: USFWS 2012; Karst Zones: George Veni Associates 2003; Streams: TCEQ 2000.

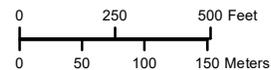

Features

- ★ Endangered species present
- Presence/absence survey conducted; No endangered species detected
- Not karst invertebrate habitat
- Historic, destroyed, not found, not evaluated, GA-only

Karst Zones

- 1: Known to contain endangered species
- 2: High probability for endangered species
- 3: Probably do not contain endangered species
- 4: Requires further research
- 5: Does not contain endangered species

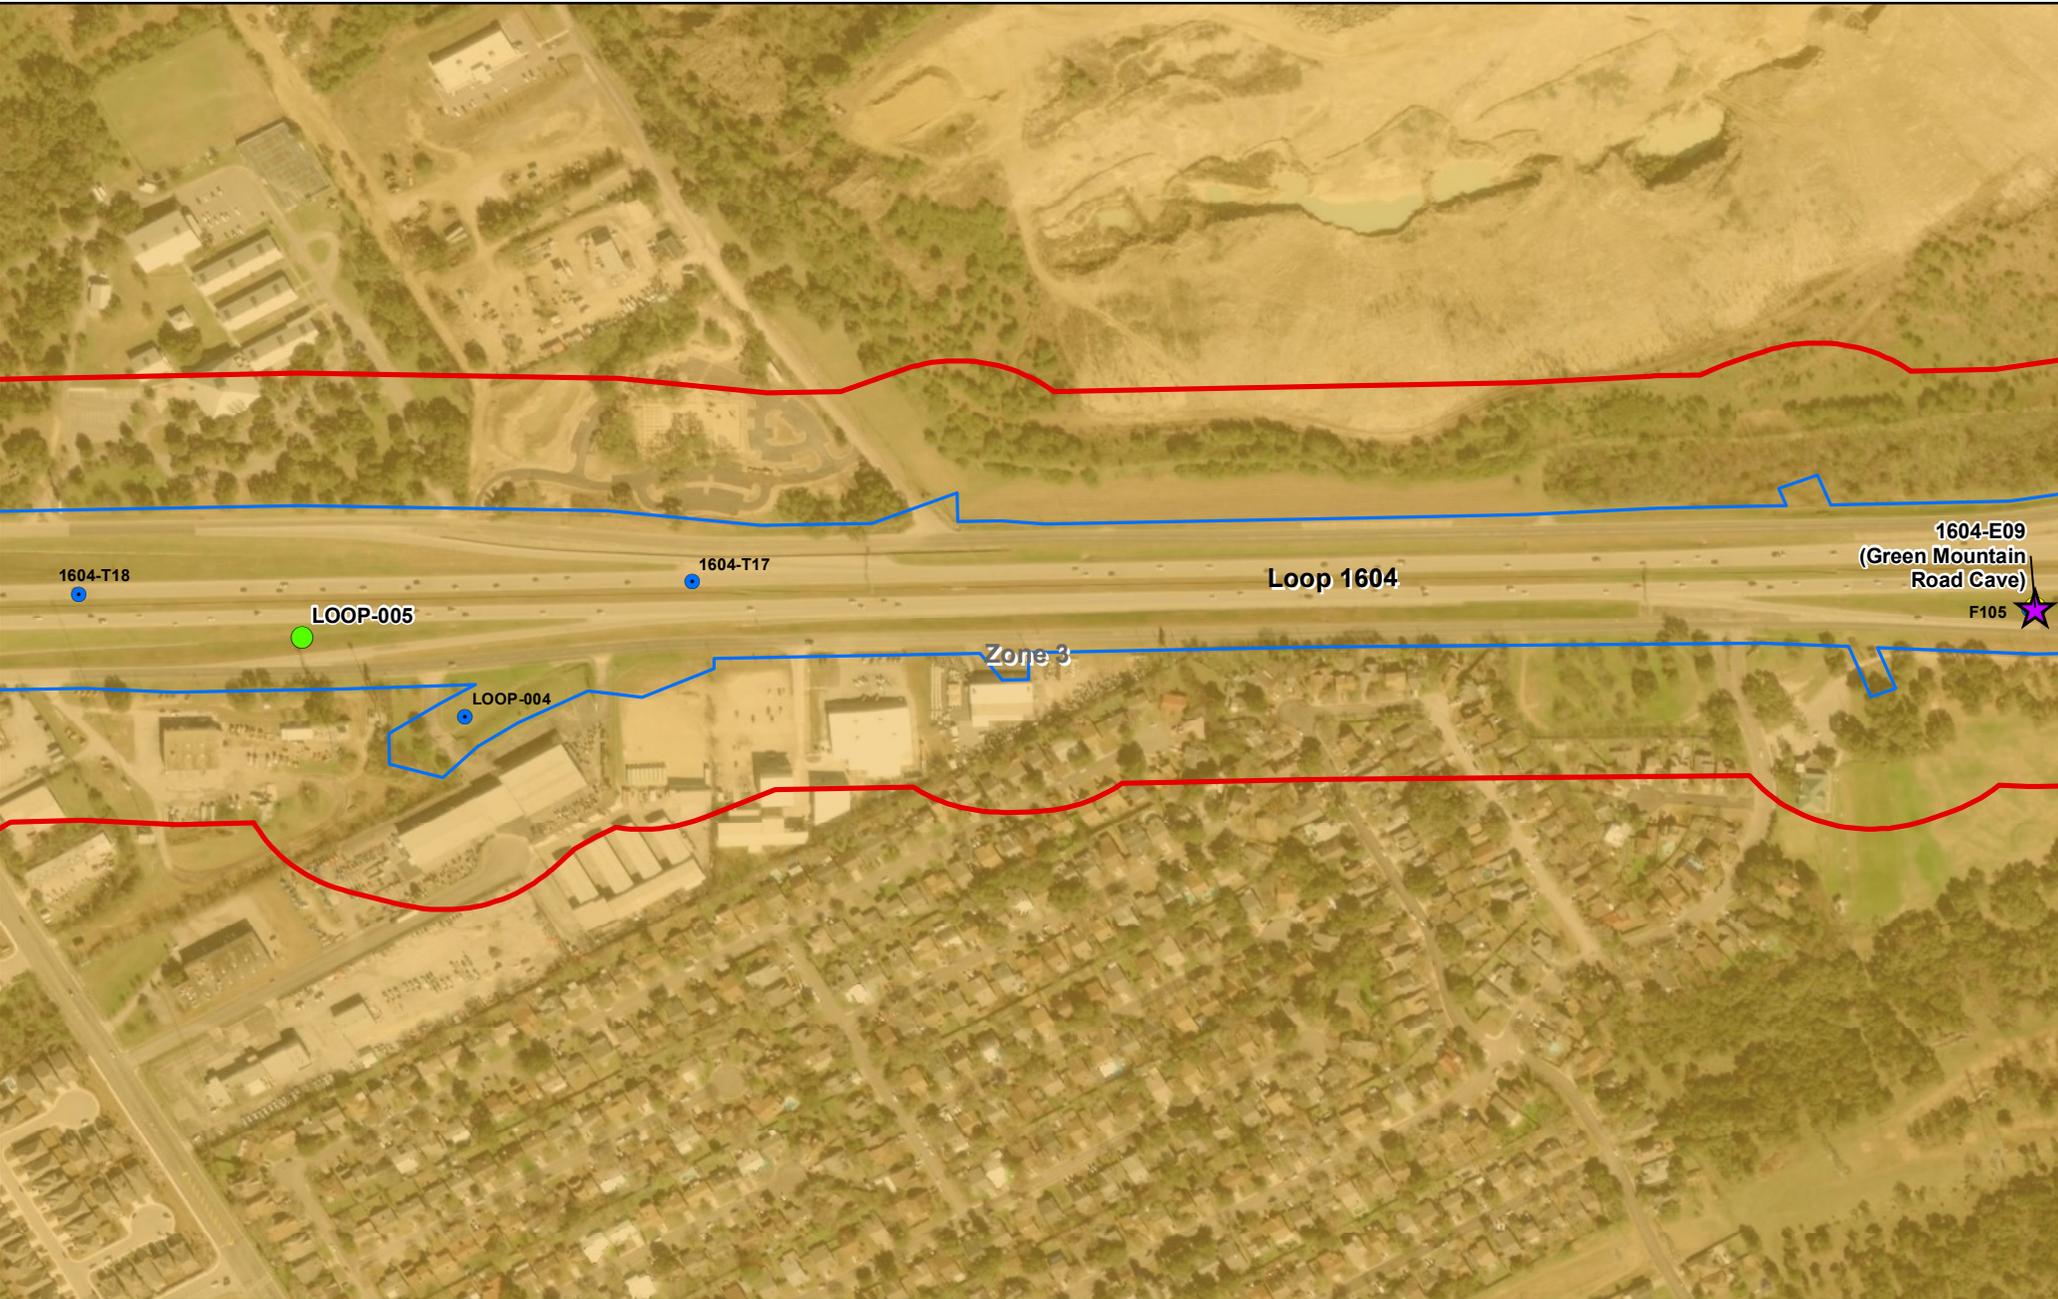

- Project Area
- Action Area
- Critical Habitat Unit
- Streams

Appendix E - 32

Basemap: ESRI 2020; Critical Habitat Units: USFWS 2012; Karst Zones: George Veni Associates 2003; Streams: TCEQ 2000.

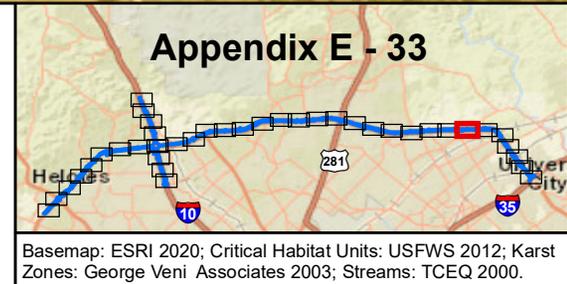

Features

- ★ Endangered species present
- Presence/absence survey conducted; No endangered species detected
- Not karst invertebrate habitat
- Historic, destroyed, not found, not evaluated, GA-only

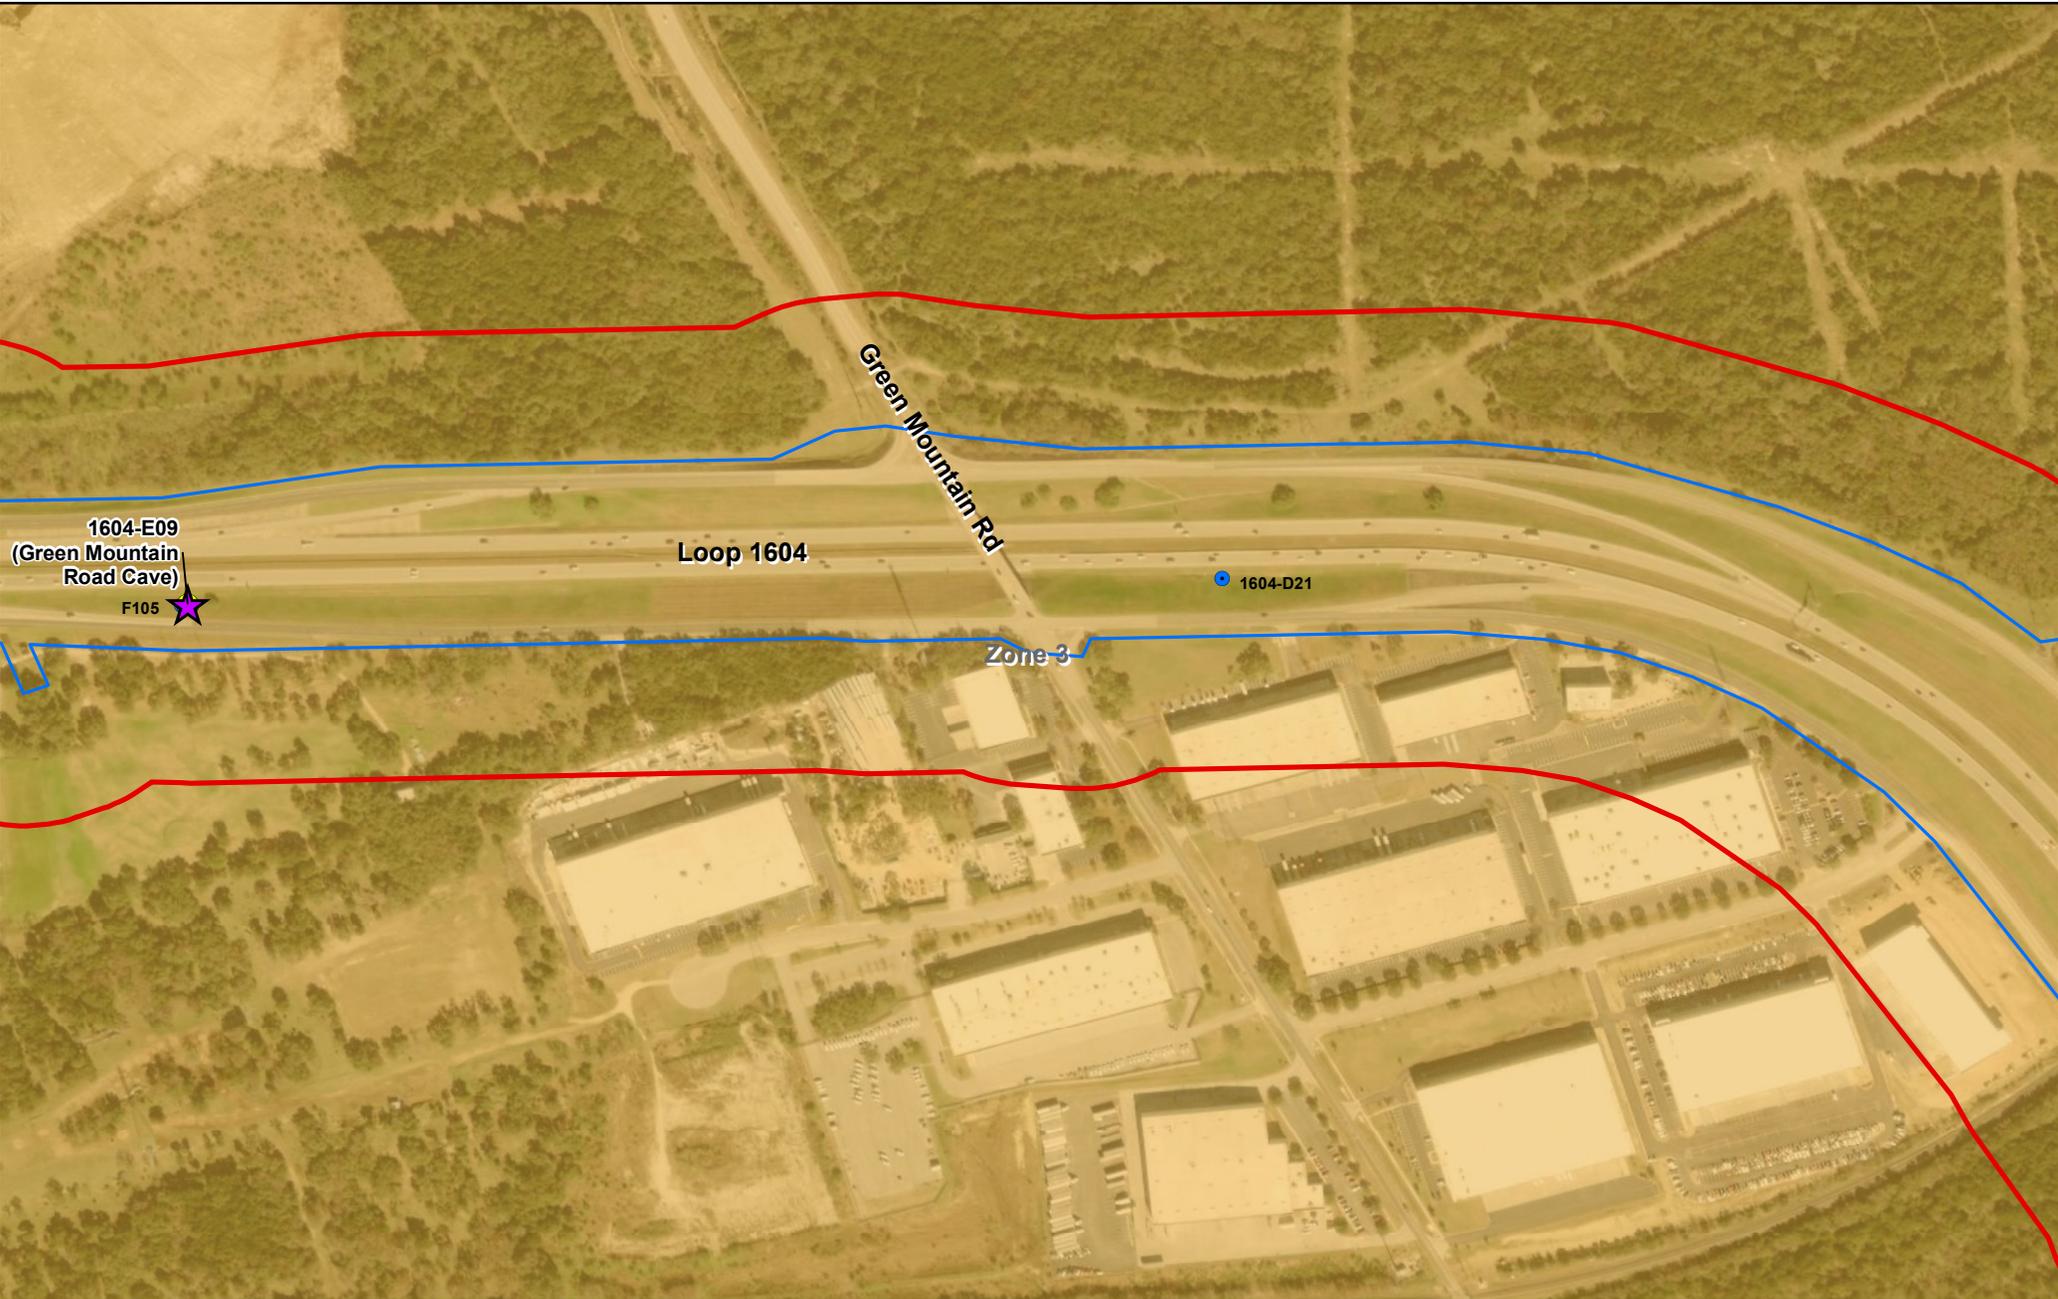

Karst Zones

- 1: Known to contain endangered species
- 2: High probability for endangered species
- 3: Probably do not contain endangered species
- 4: Requires further research
- 5: Does not contain endangered species

- Project Area
- Action Area
- Critical Habitat Unit
- Streams

Basemap: ESRI 2020; Critical Habitat Units: USFWS 2012; Karst Zones: George Veni Associates 2003; Streams: TCEQ 2000.

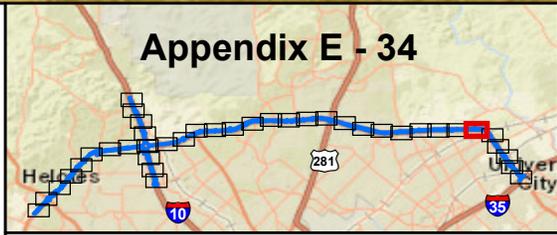

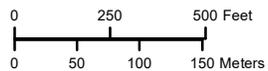

Features

- ★ Endangered species present
- Presence/absence survey conducted; No endangered species detected
- Not karst invertebrate habitat
- Historic, destroyed, not found, not evaluated, GA-only

Karst Zones

- 1: Known to contain endangered species
- 2: High probability for endangered species
- 3: Probably do not contain endangered species
- 4: Requires further research
- 5: Does not contain endangered species

- Project Area
- Action Area
- Critical Habitat Unit
- Streams

Basemap: ESRI 2020; Critical Habitat Units: USFWS 2012; Karst Zones: George Veni Associates 2003; Streams: TCEQ 2000.

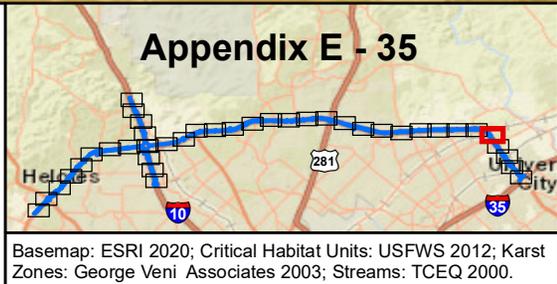

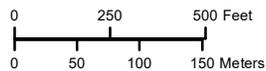

Features

- ★ Endangered species present
- Presence/absence survey conducted; No endangered species detected
- Not karst invertebrate habitat
- Historic, destroyed, not found, not evaluated, GA-only

Karst Zones

- 1: Known to contain endangered species
- 2: High probability for endangered species
- 3: Probably do not contain endangered species
- 4: Requires further research
- 5: Does not contain endangered species

- Project Area
- Action Area
- Critical Habitat Unit
- Streams

Basemap: ESRI 2020; Critical Habitat Units: USFWS 2012; Karst Zones: George Veni Associates 2003; Streams: TCEQ 2000.

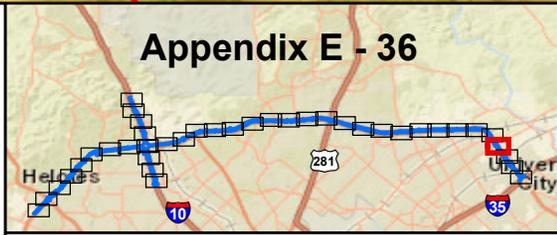

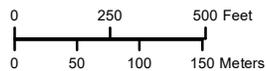

Features

- ★ Endangered species present
- Presence/absence survey conducted; No endangered species detected
- Not karst invertebrate habitat
- Historic, destroyed, not found, not evaluated, GA-only

Karst Zones

Appendix F. Vegetation sketches

Appendix F. Vegetation sketches for features where presence/absence surveys were performed.

Feature 1604-D07

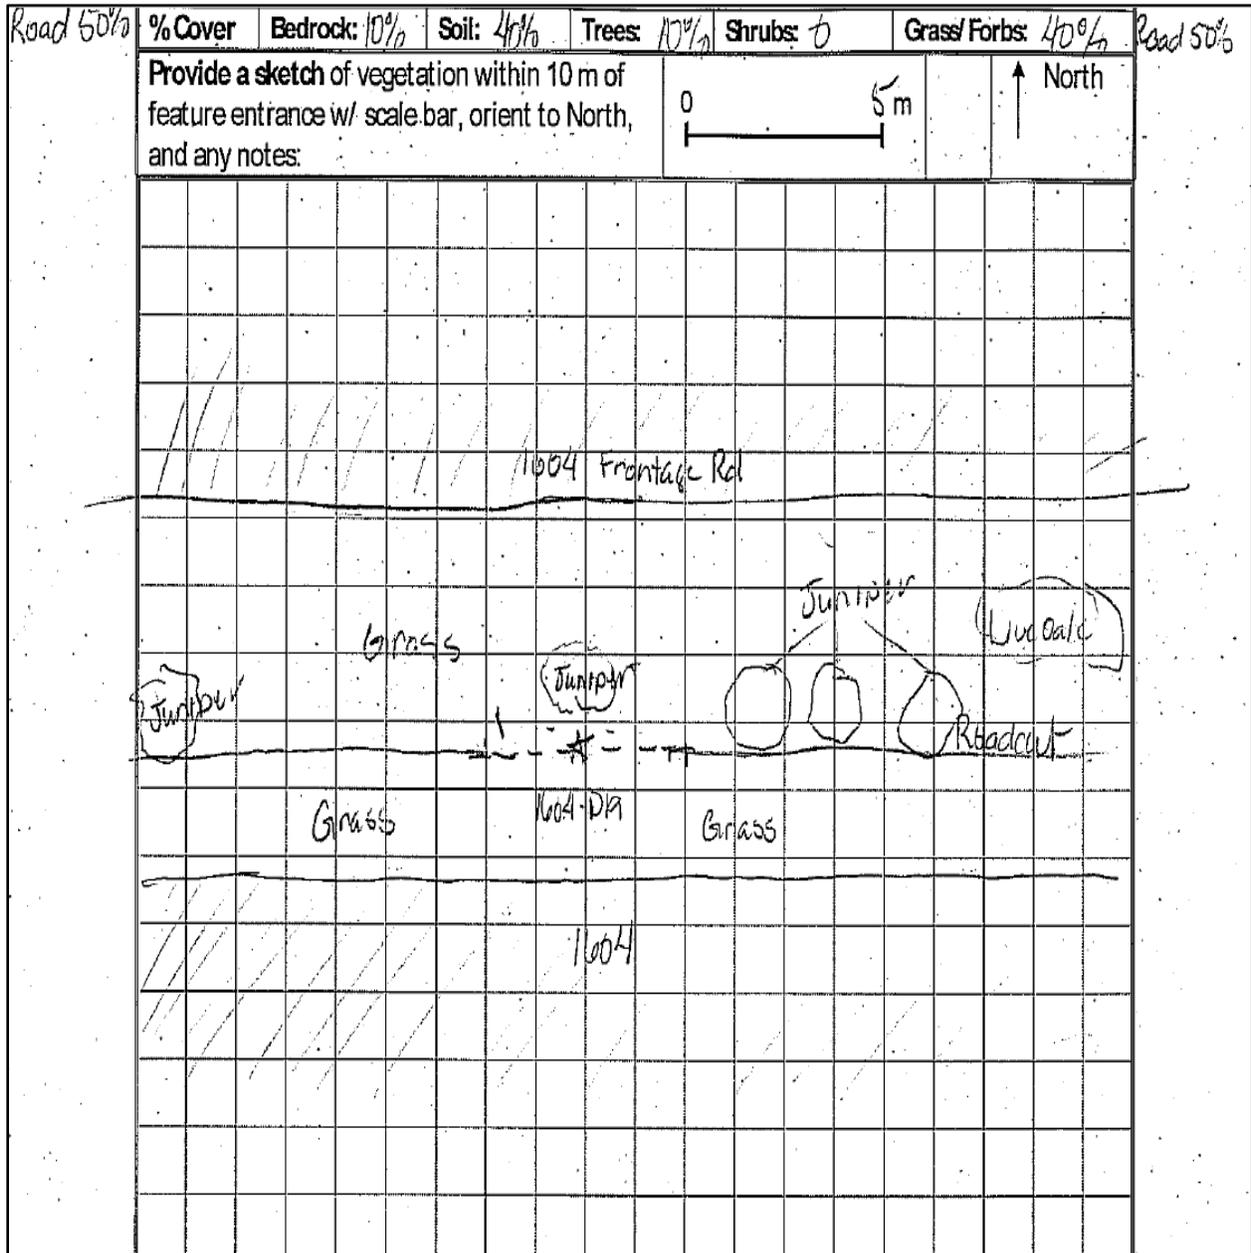

Figure F-1. Vegetation sketch for feature 1604-D07.

Feature 1604-D19

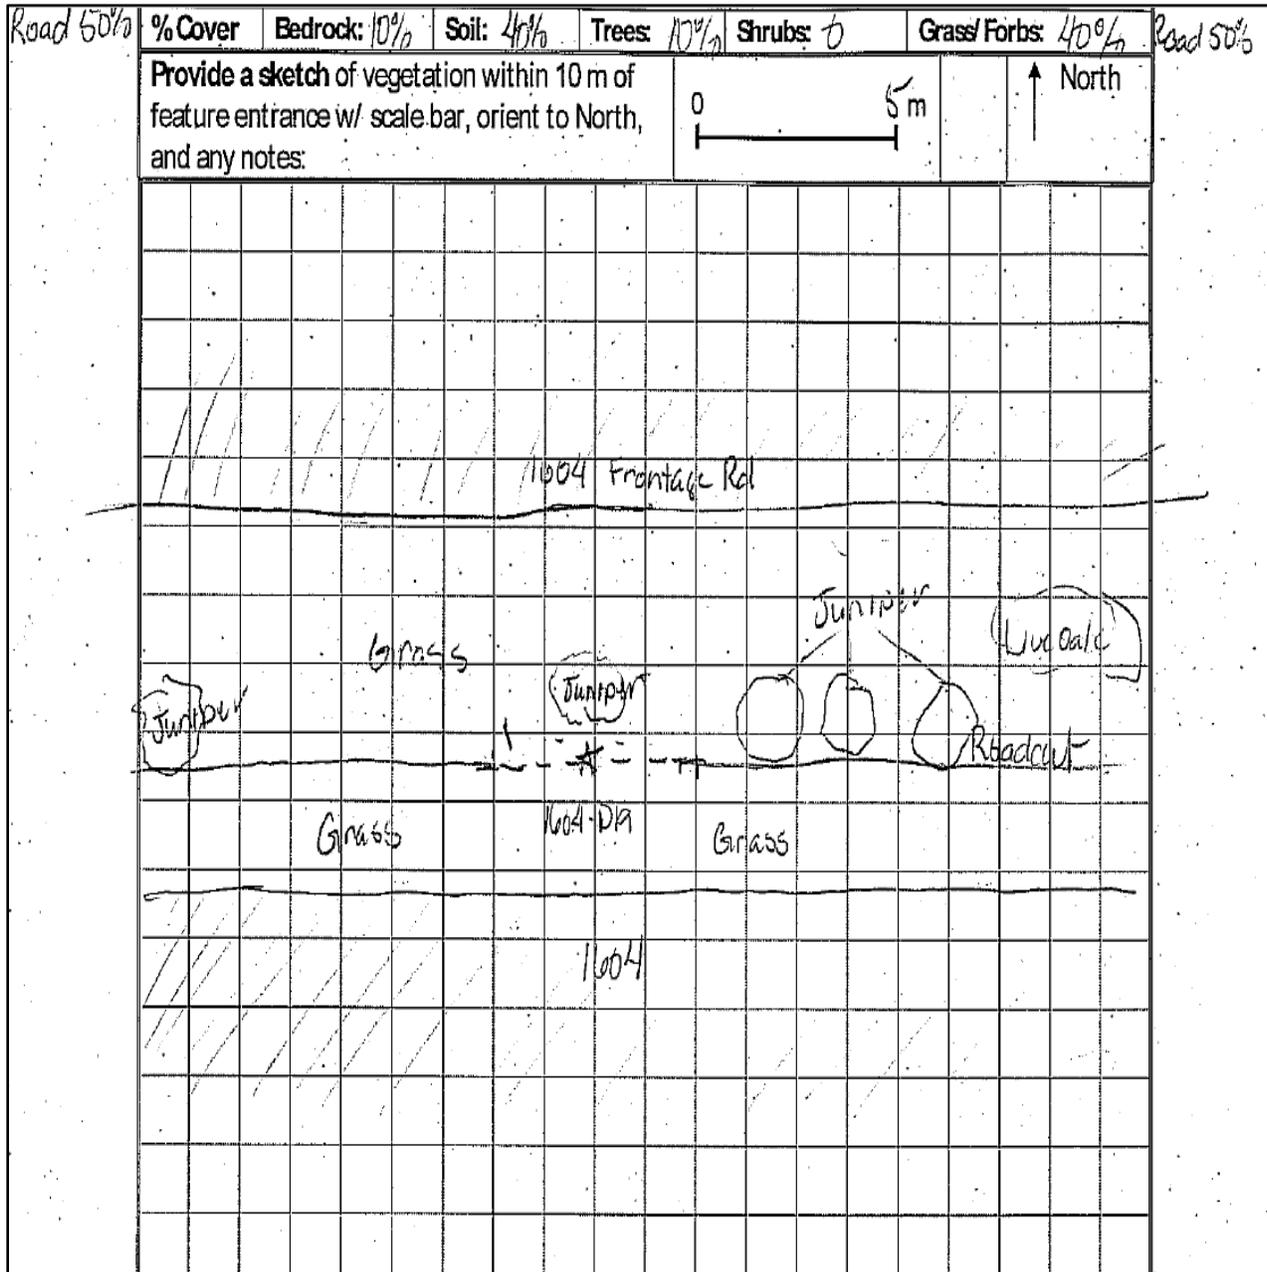

Figure F-2. Vegetation sketch for Feature 1604-D19.

Feature 1604-E09 (Green Mountain Road Cave)

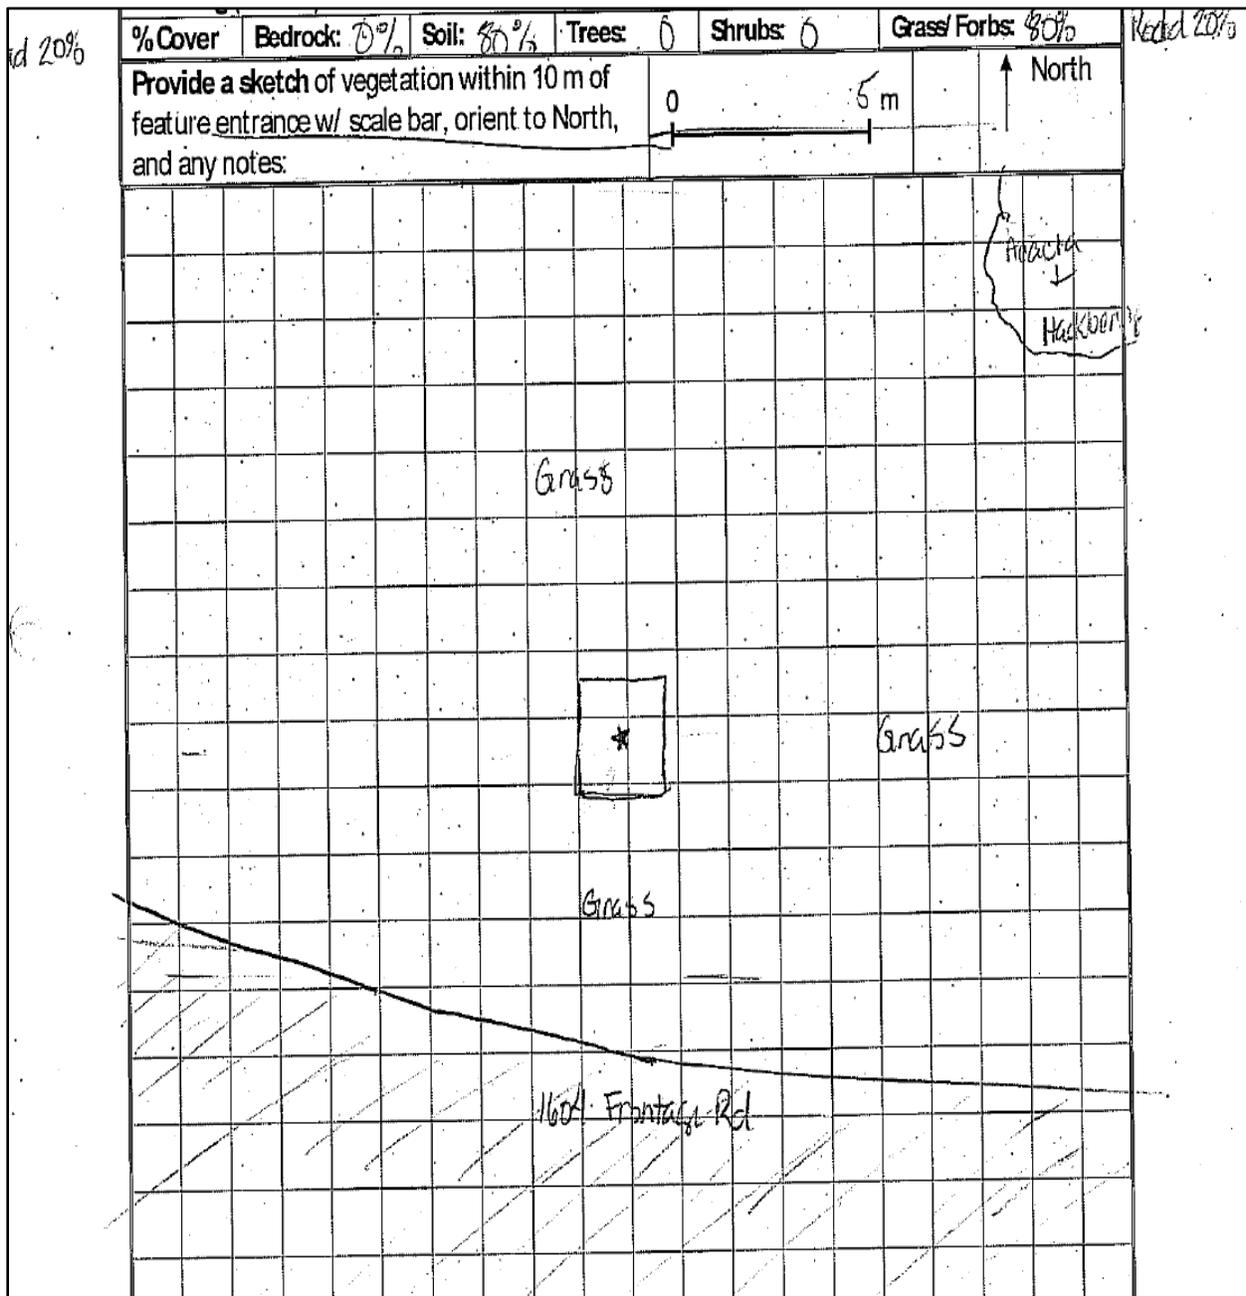

Figure F-3. Vegetation sketch for Feature 1604-E09 (Green Mountain Road Cave).

Feature 1604-F061 (Scottish Beard Cave)

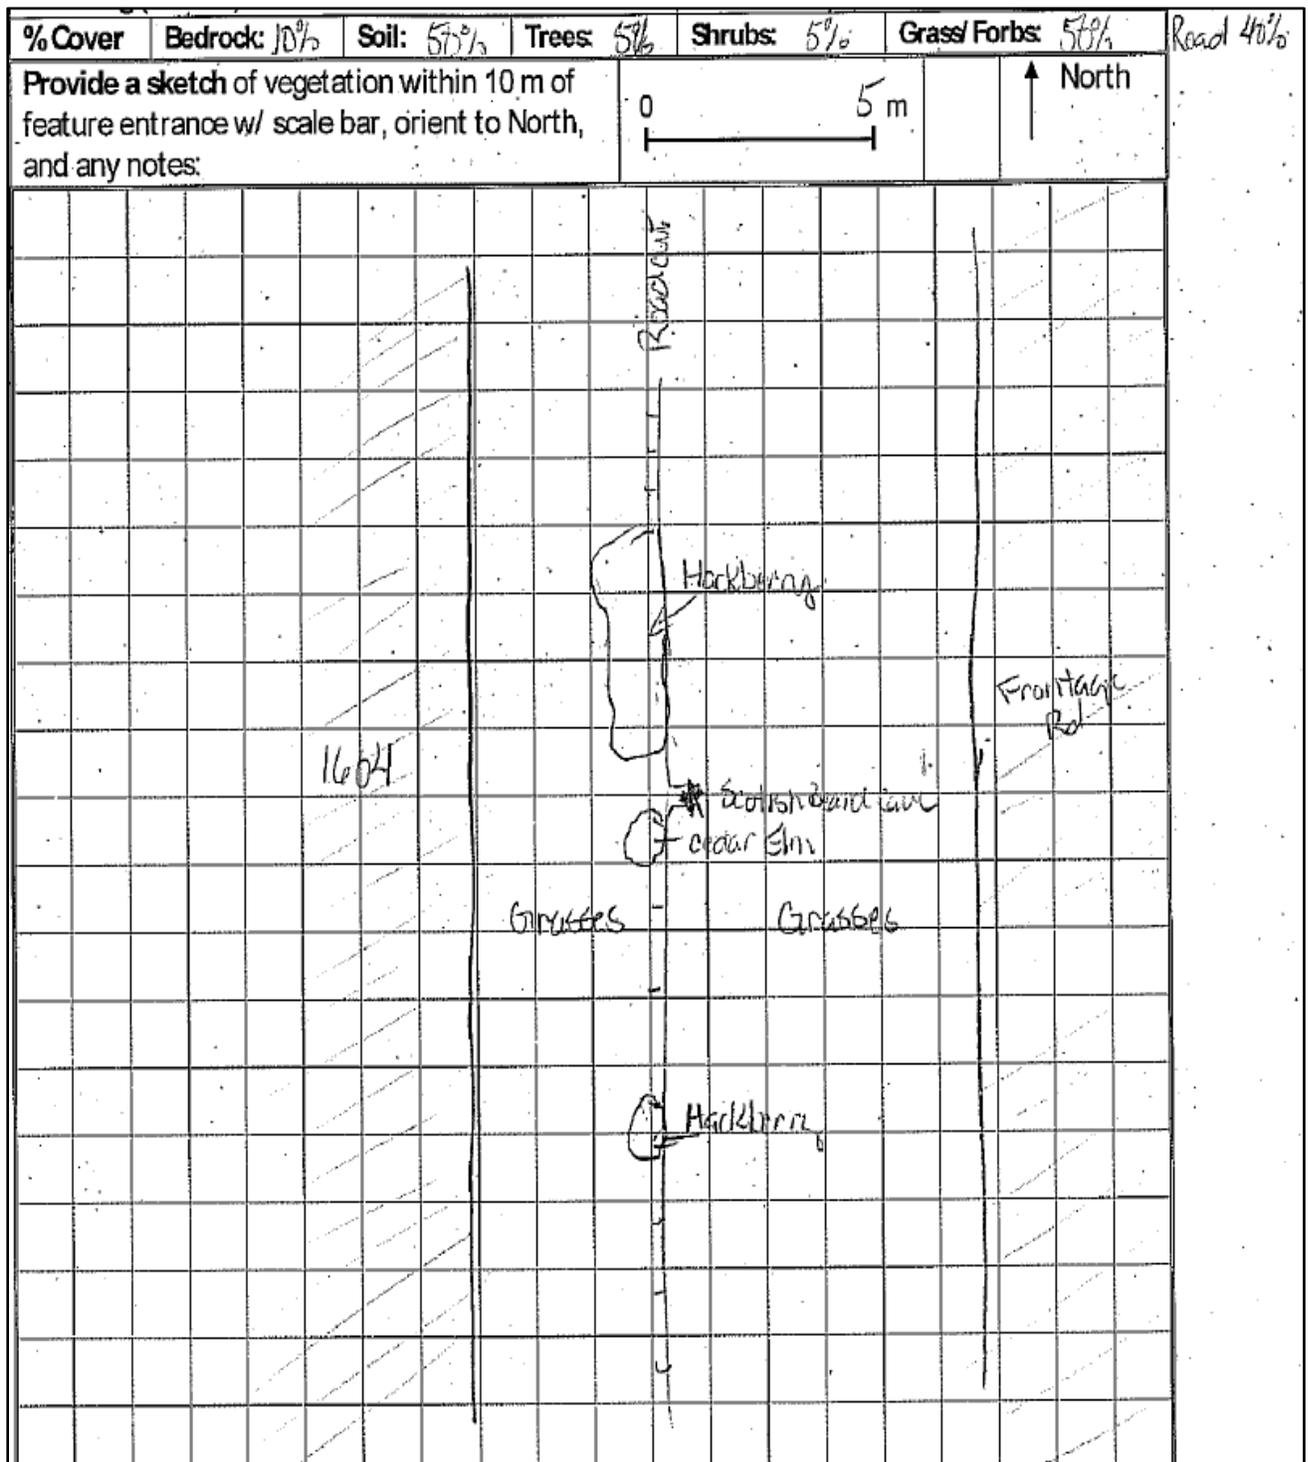

Figure F-4. Vegetation sketch for Feature 1604-061 (Scottish Beard Cave).

Feature 1604-F073

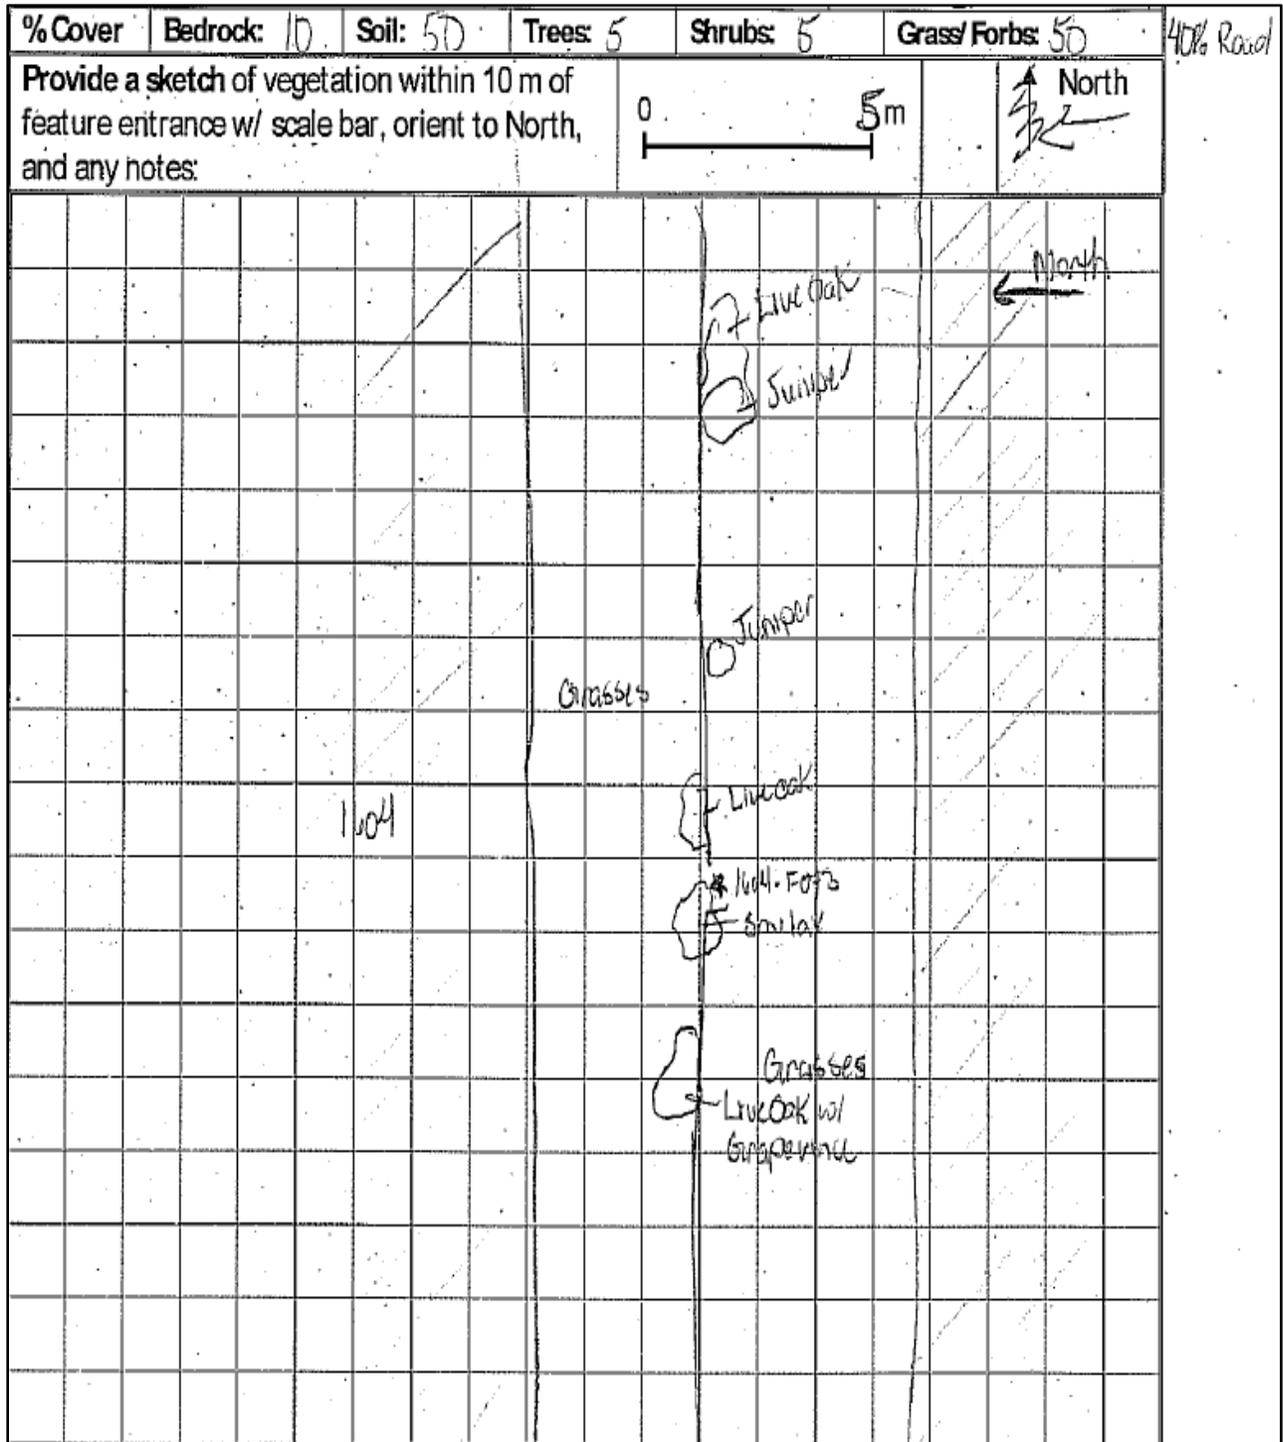

Figure F-5. Vegetation sketch for Feature 1604-F073.

Feature 1604-F077 (Hubcap Cave)

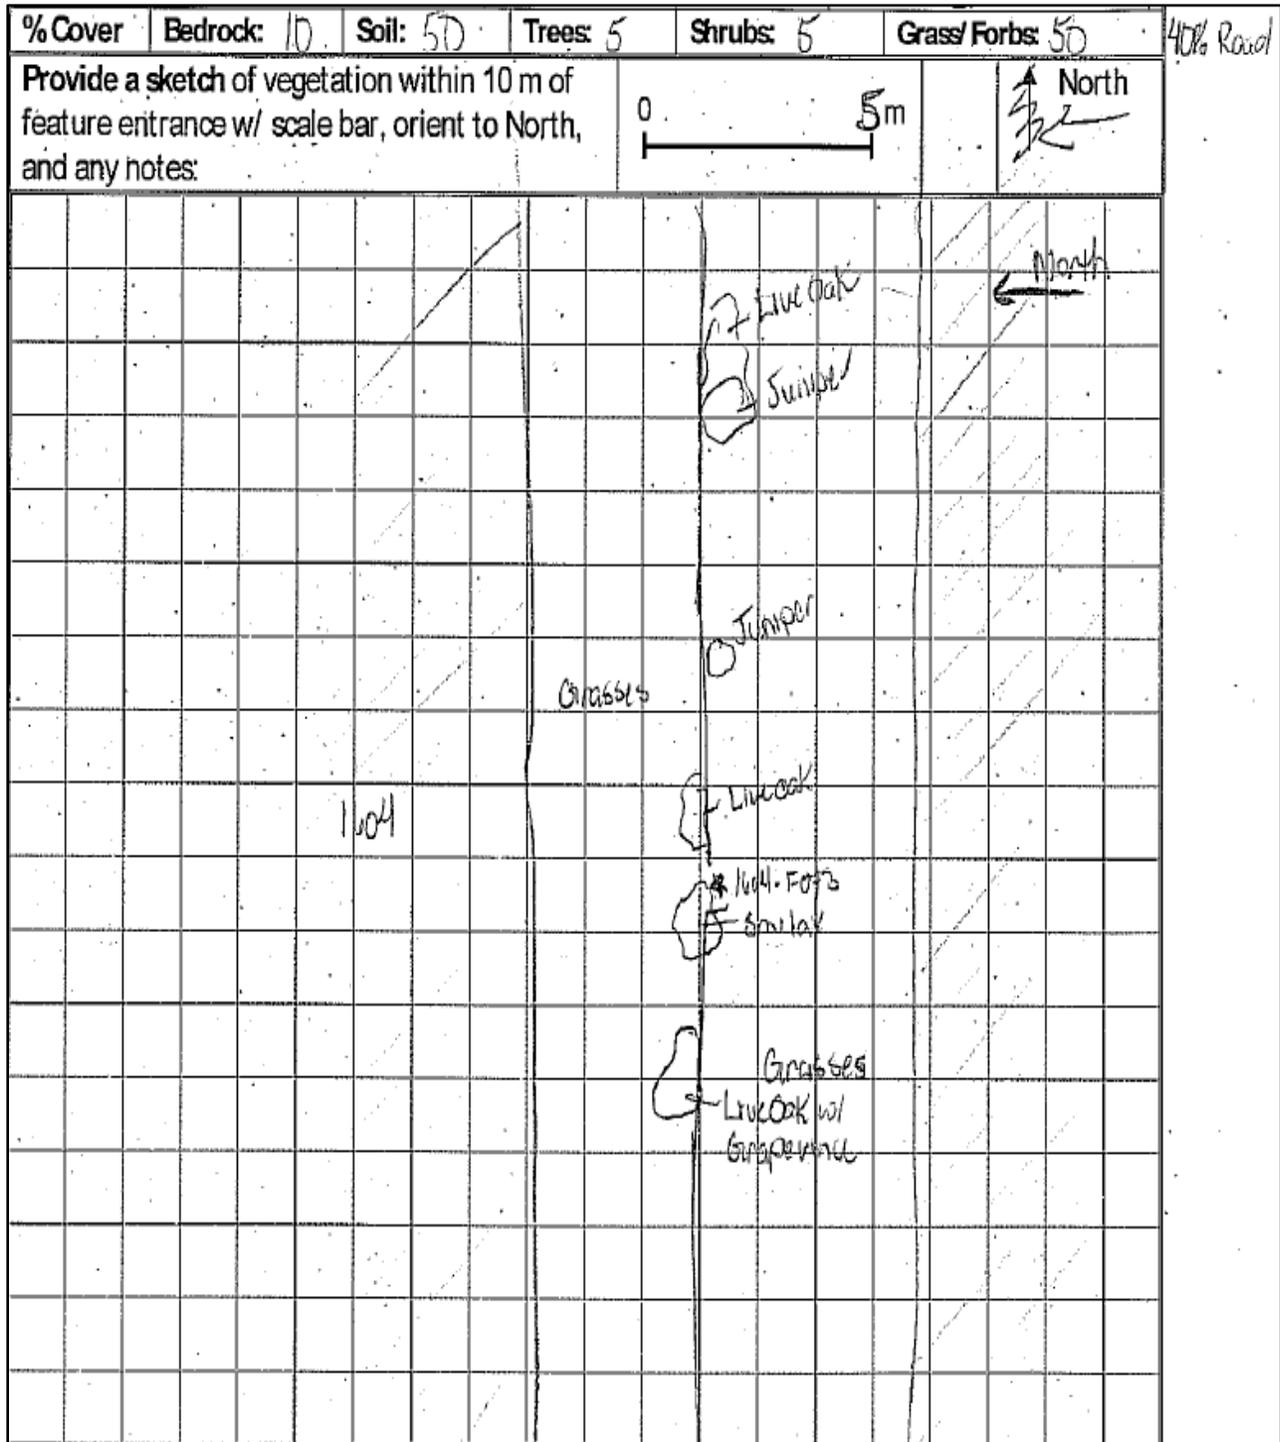

Figure F-6. Vegetation sketch for Feature 1604-F077 (Hubcap Cave).

Feature 1604-F074

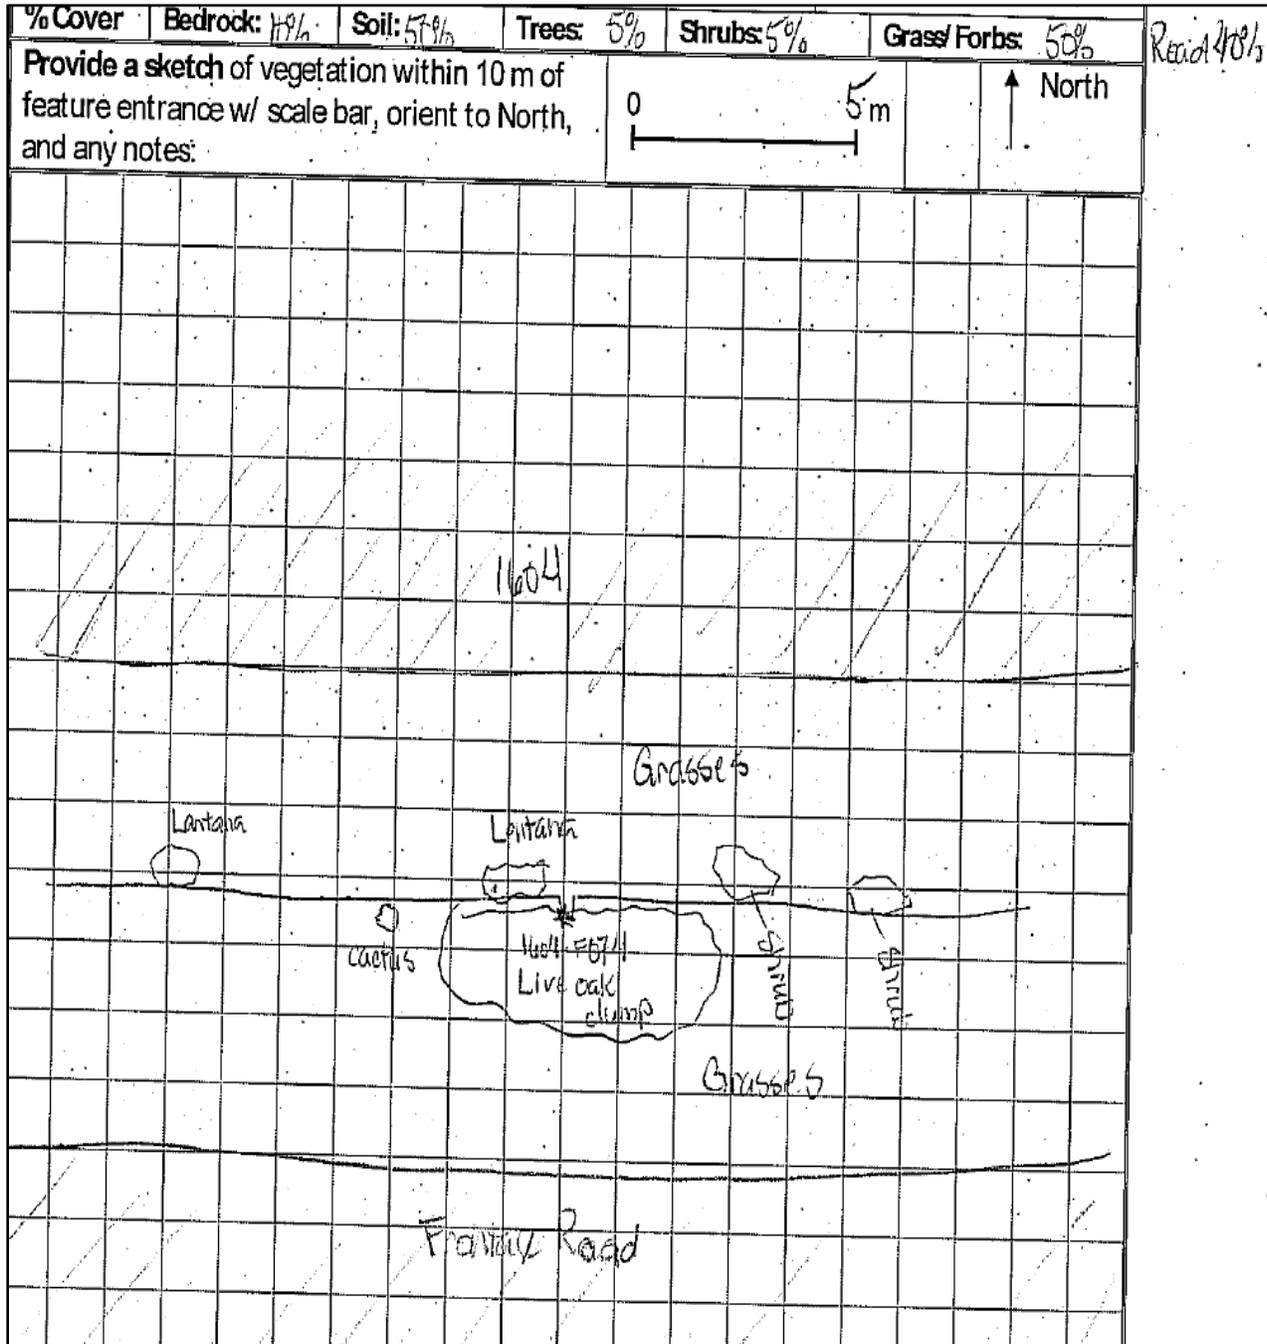

Figure F-7. Vegetation sketch for Feature 1604-F074.

Feature 1604-FZ3

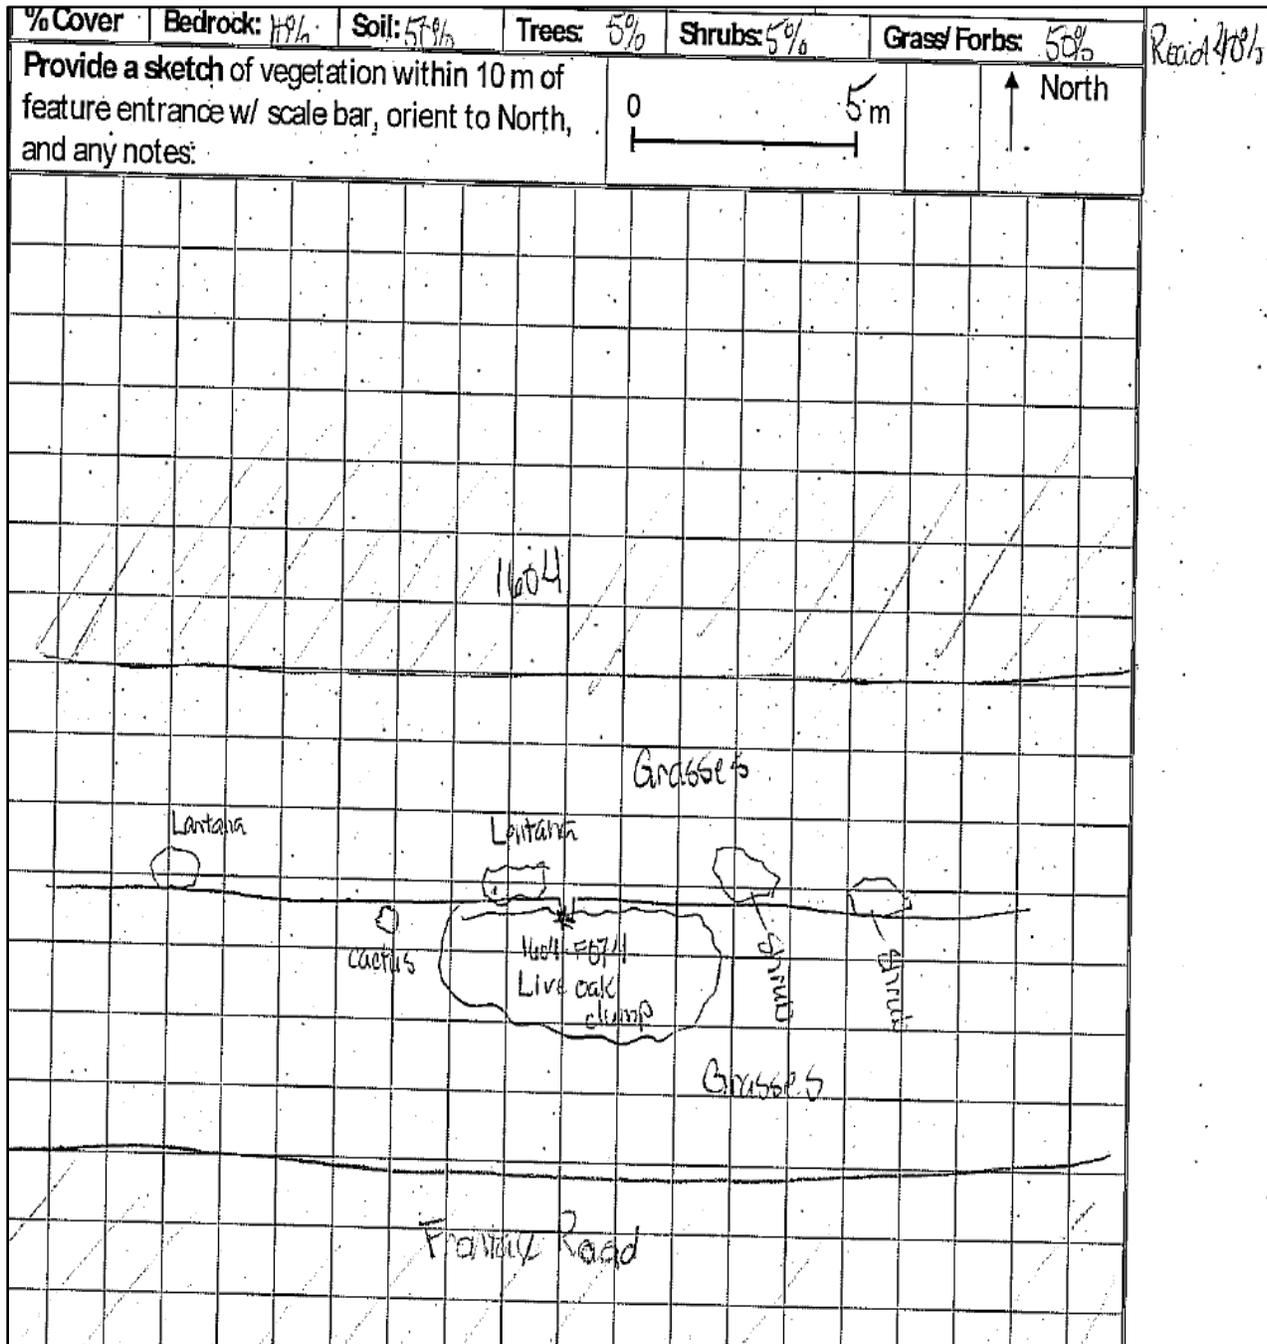

Figure F-8. Vegetation sketch for Feature 1604-FZ3.

Feature 1604-FZ4

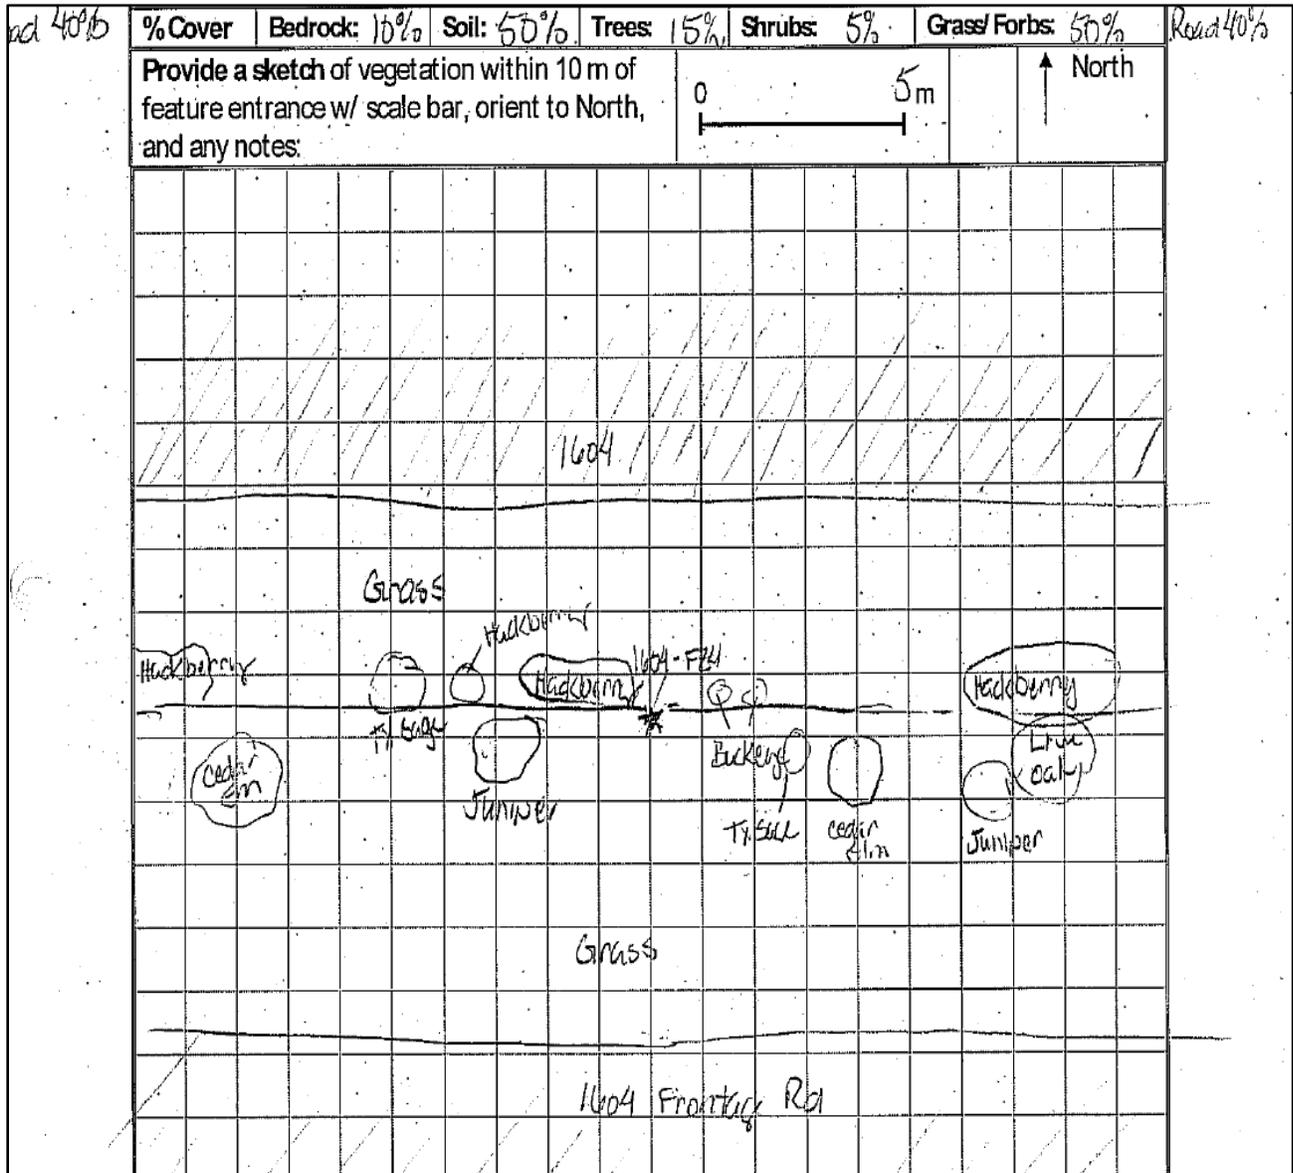

Figure F-9. Vegetation sketch for Feature 1604-FZ4.

Feature 1604-FZ7

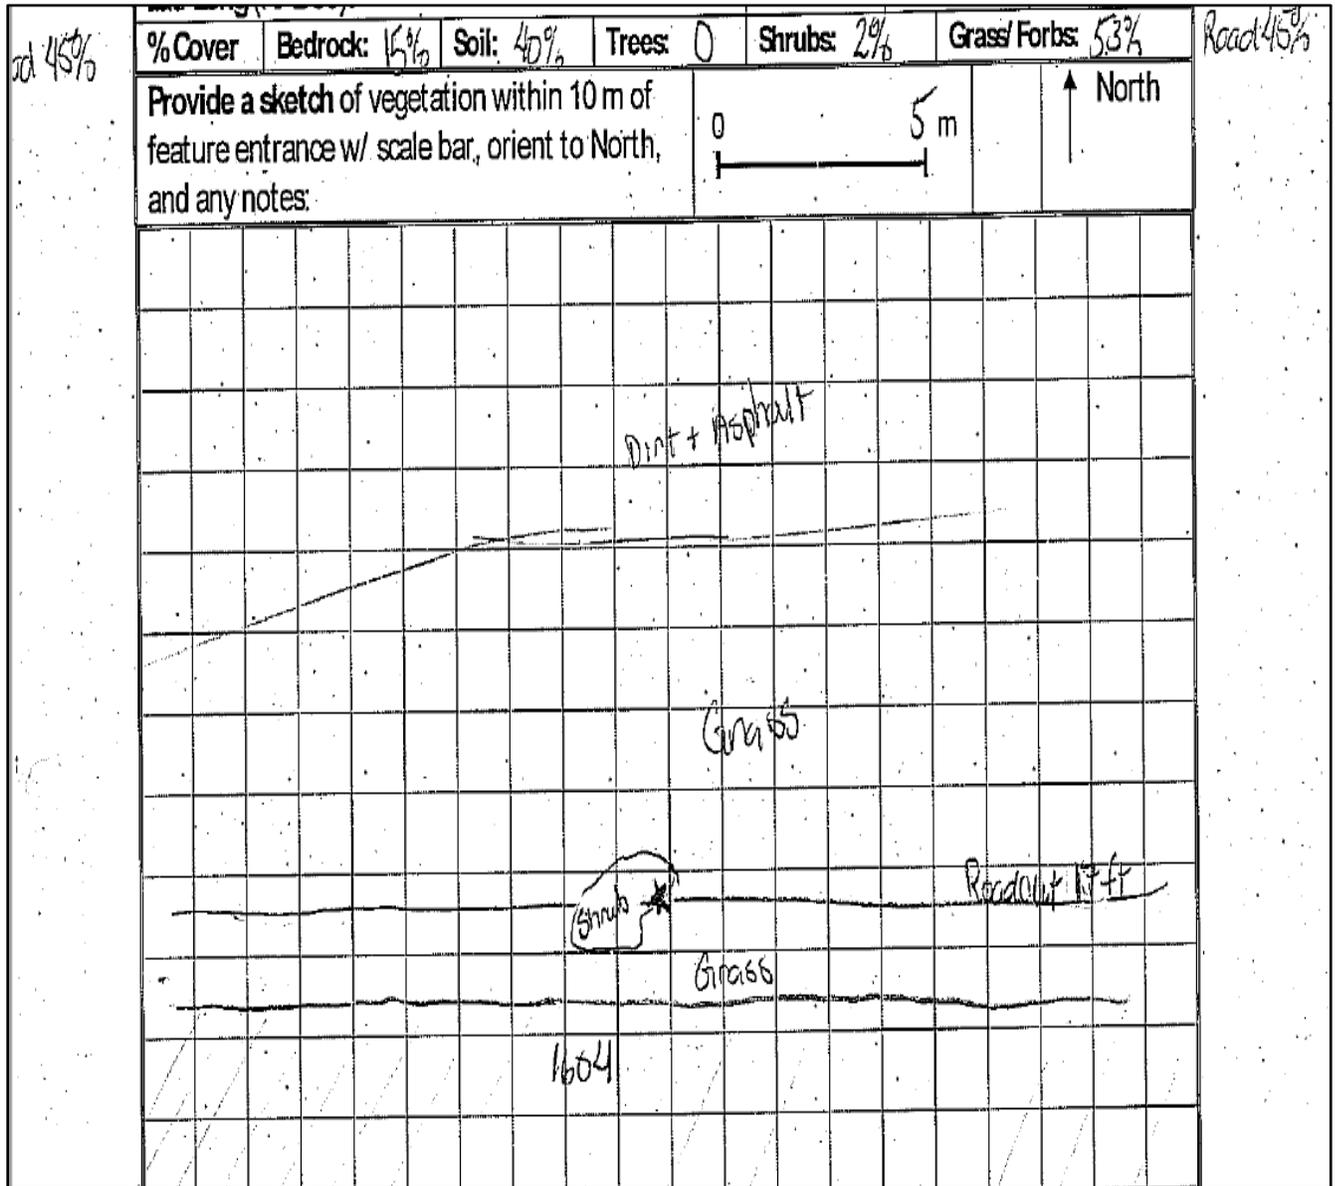

Figure F-10. Vegetation sketch for Feature 1604-FZ7.

Feature 1604-L12

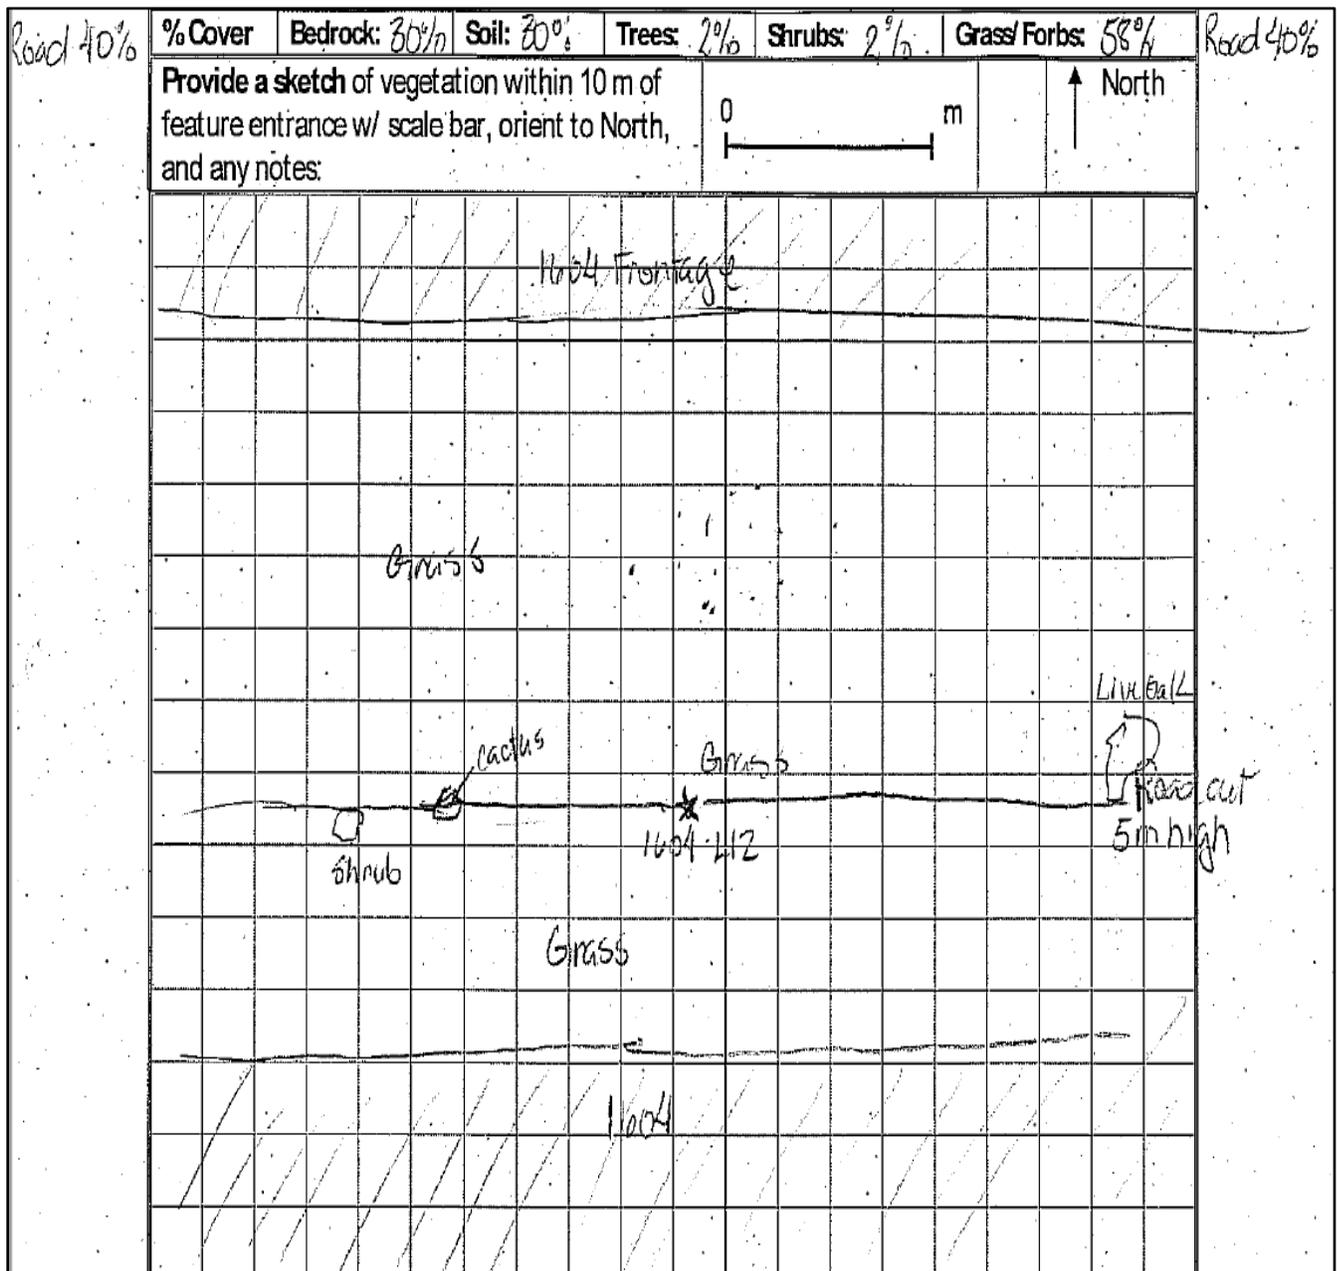

Figure F-11. Vegetation sketch for Feature 1604-L12.

Feature 1604-L13

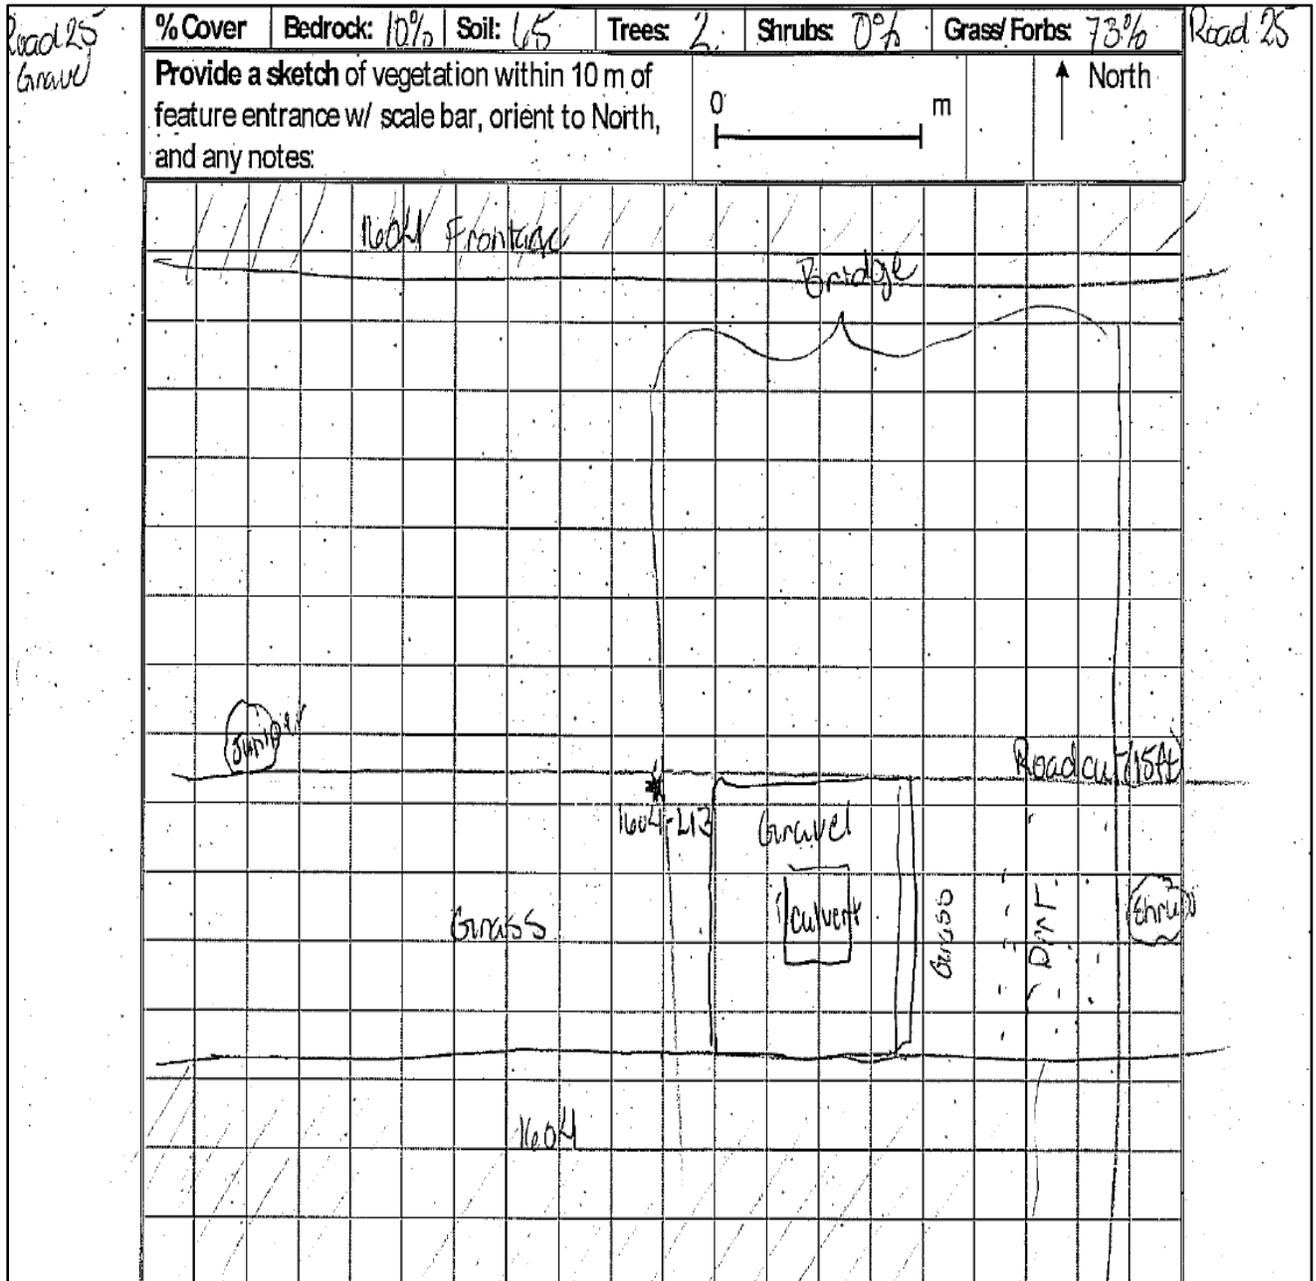

Figure F-12. Vegetation sketch for Feature 1604-L13.

Feature 1604-L16 (12A Cave)

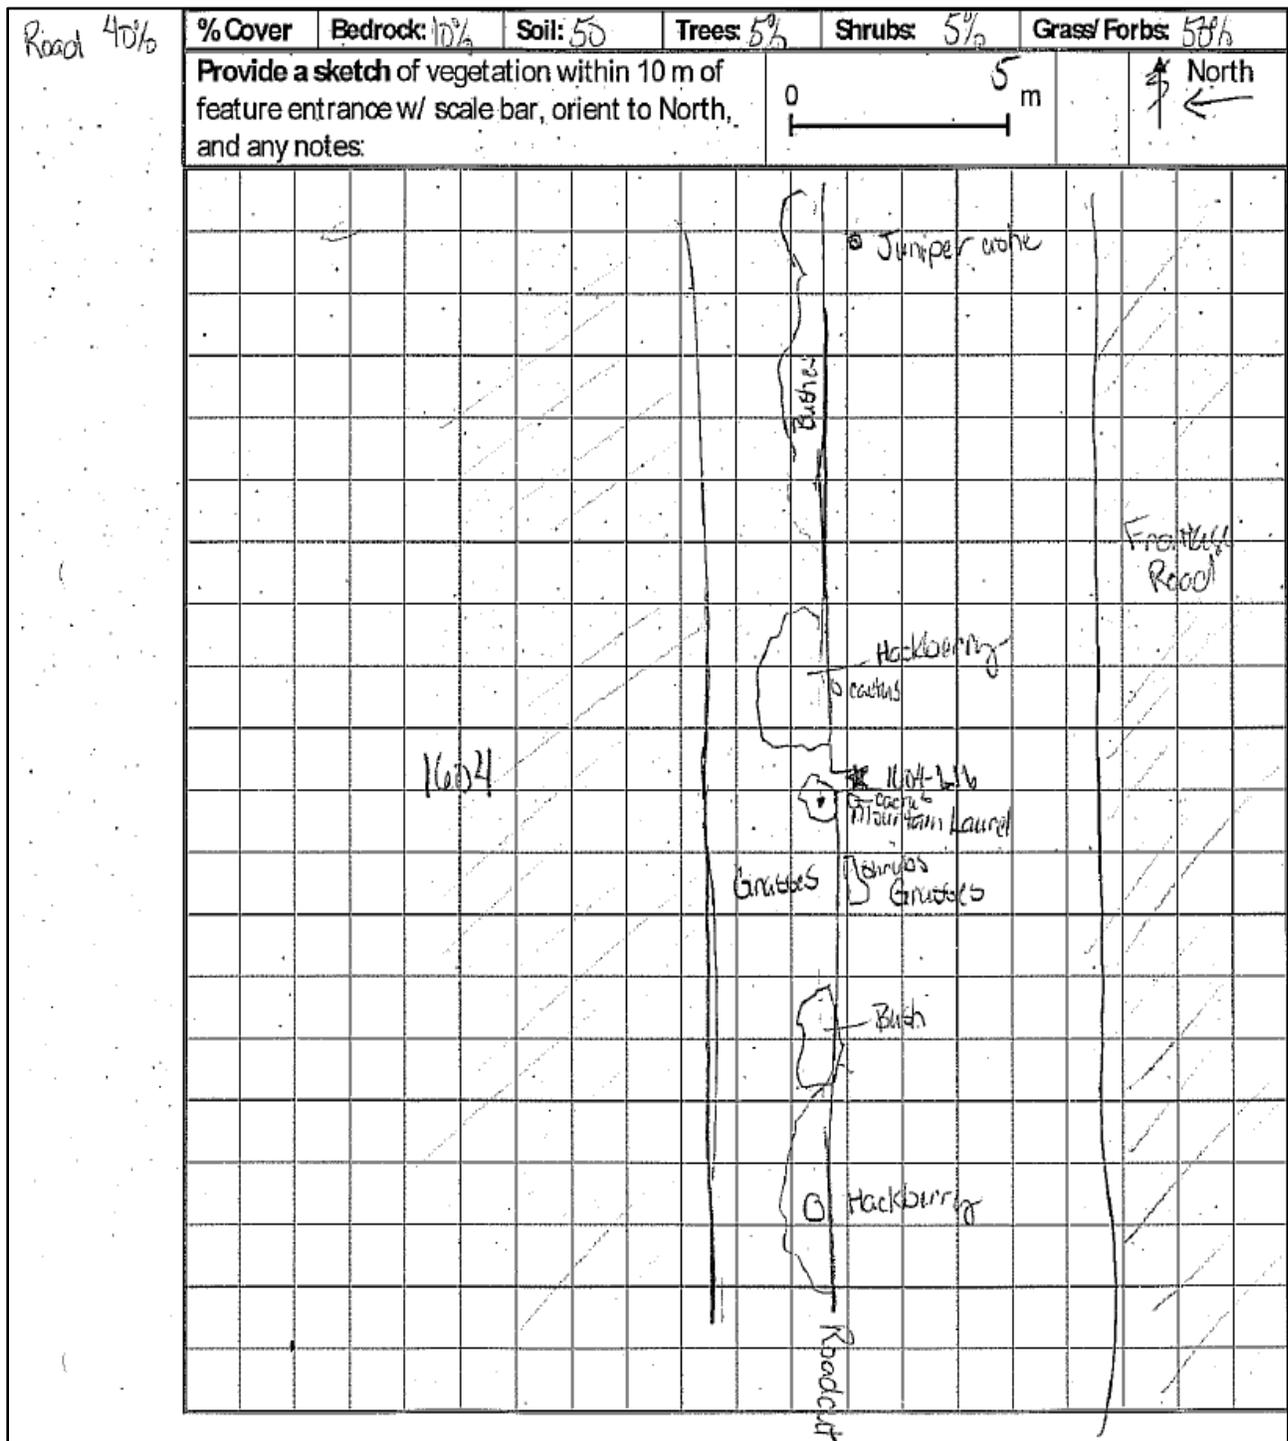

Figure F-13. Vegetation sketch for Feature 1604-L16 (12A Cave).

Feature 1604-R03

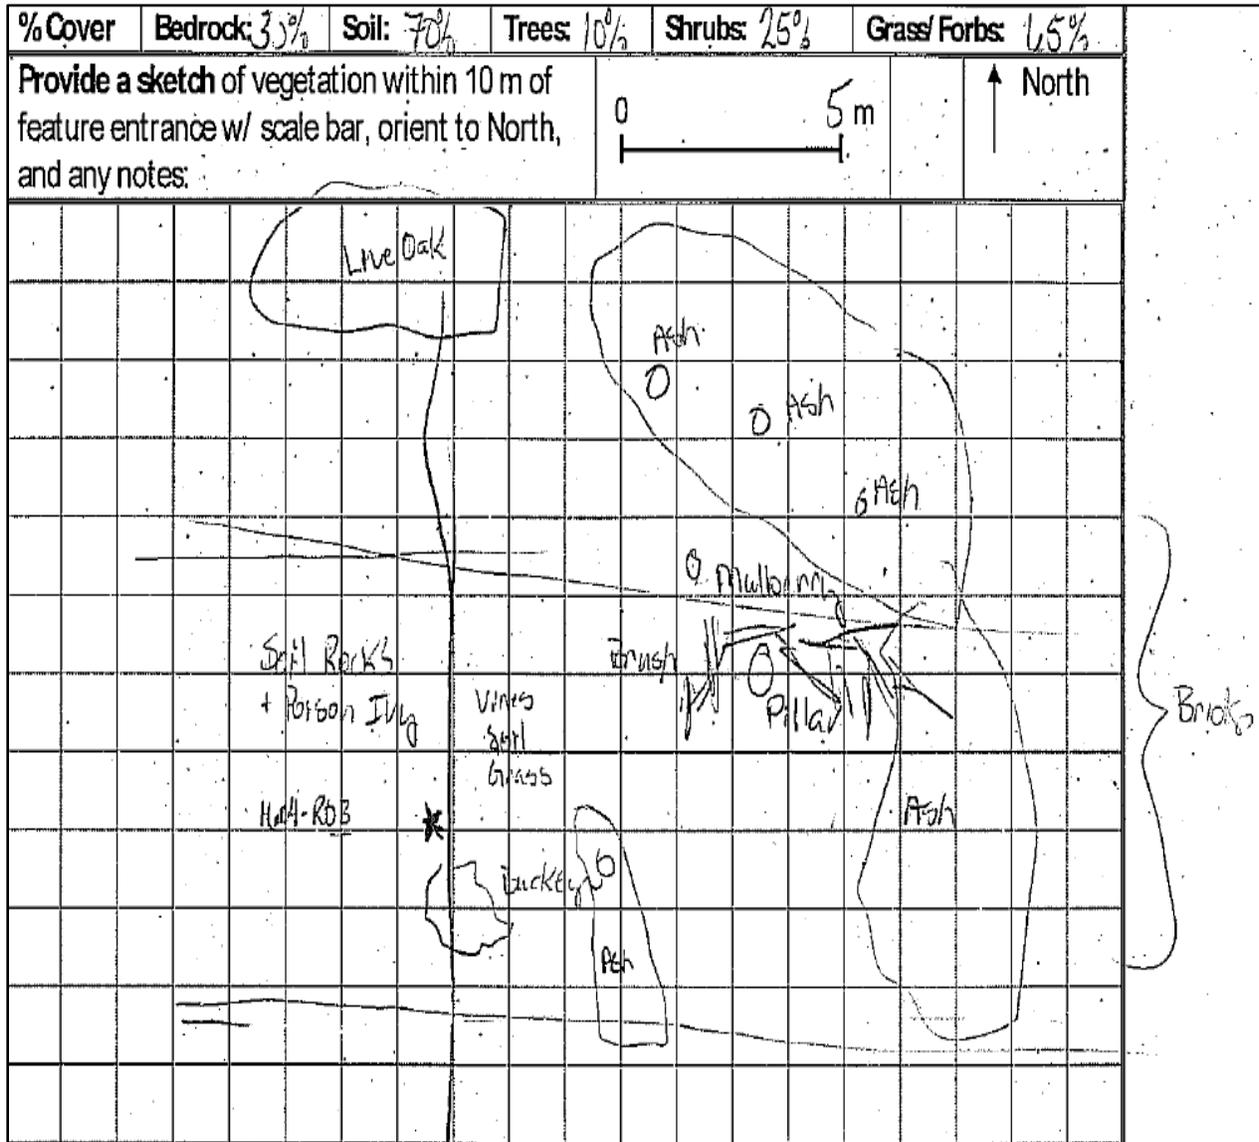

Figure F-14. Vegetation sketch for Feature 1604-R03.

Feature 1604-R04

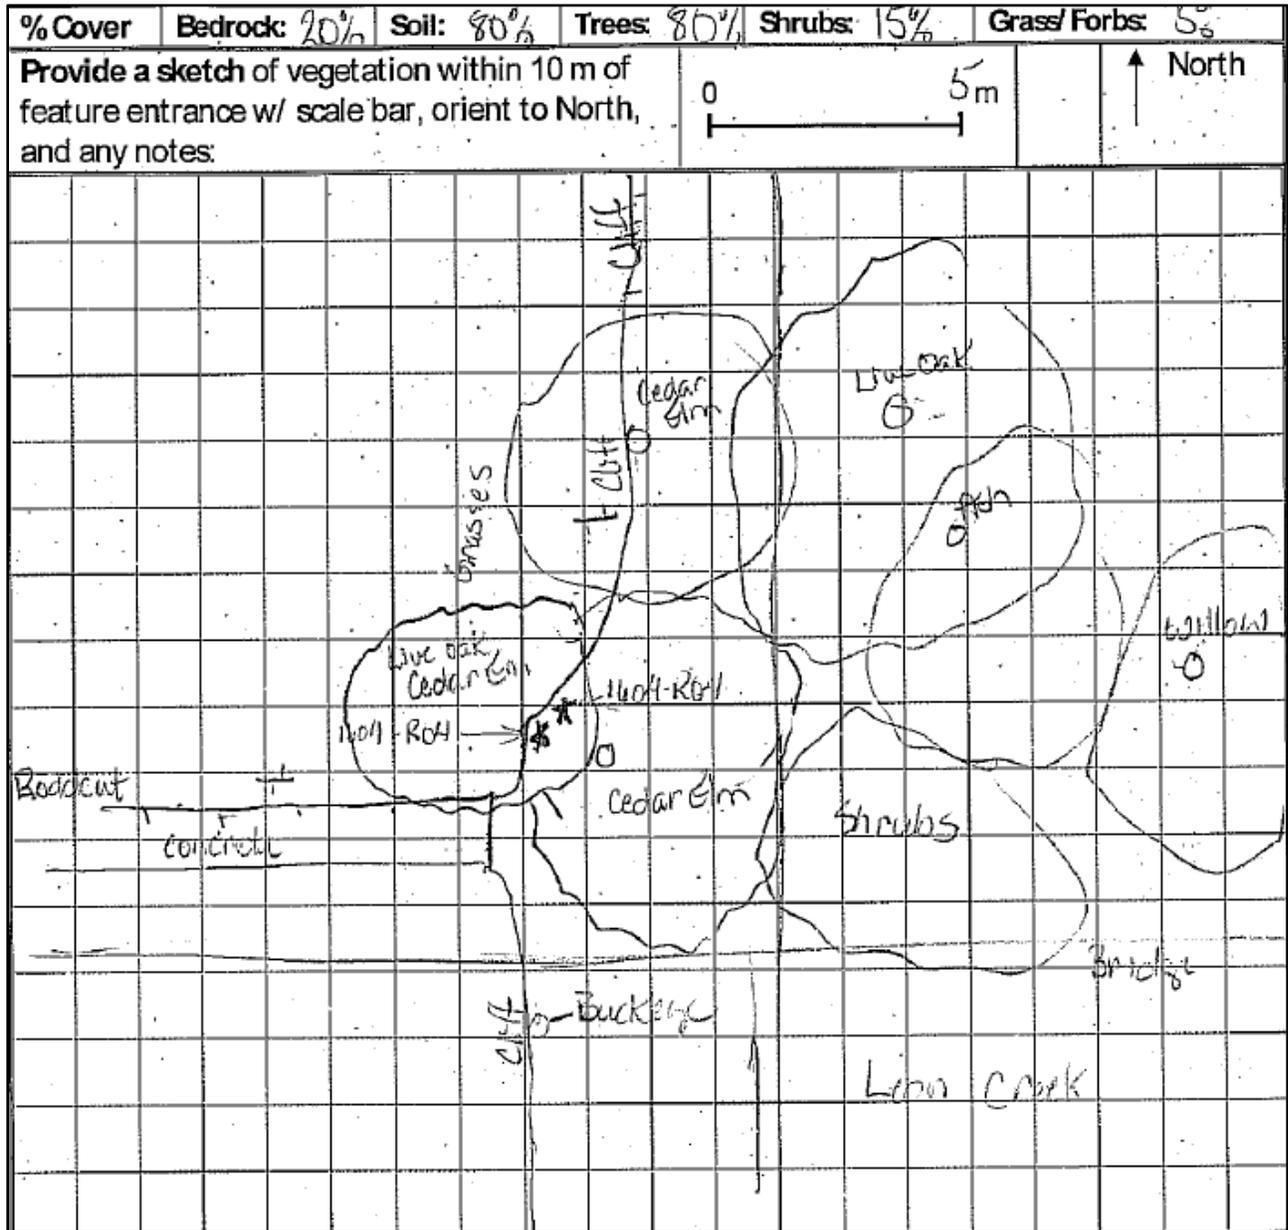

Figure F-15. Vegetation sketch for Feature 1604-R04.

Feature 1604-R05
