1.0 Introduction and Purpose

The Texas Department of Transportation (TxDOT) proposes expansion of Loop 1604 from State Highway (SH) 16 west to Interstate Highway (I)-35 in Bexar County, Texas (**Attachment A, Figures 1a-1d**). The purpose of the project is to accommodate current and future traffic volumes on Loop 1604 from SH 16 to I-35.

TxDOT proposes to expand Loop 1604 from a four-lane expressway to a 10-lane expressway by adding two general purpose lanes and one high-occupancy vehicle (HOV) special-purpose lane in each direction. The layout of auxiliary lanes and entrance and exit ramps would be reconfigured. The interchange at I-10 would be modernized by removing the cloverleaf connectors, adding direct connectors, and replacing the signalized frontage road intersections with a continuous-flow configuration. The project would also include accommodations for bicyclists and pedestrians, water quality protection, and other highway features. All improvements would be located within the existing right-of-way and easements. The project would not include any toll components.

The purpose of this Surface Water Resources Technical Report is to evaluate potential water resources and regulatory issues associated with the proposed improvements to Loop 1604, including the potential for impacts to Waters of the United States (U.S.), including wetlands, water quality, floodplains, and groundwater. Relevant water resources within the project area include several creeks, tributaries, floodplains, two aquifers, and wetlands. In addition, three important regulatory zones are present: the Edwards Aquifer Contributing Zone (EACZ), Edwards Aquifer Transition Zone (EATZ), and the Edwards Aquifer Recharge Zone (EARZ).

This report also describes potentially jurisdictional wetlands and Waters of the U.S. located within the proposed project area to assist in avoidance of impacts and determine whether U.S. Army Corps of Engineers (USACE) project authorization would be required. Conclusions regarding potential USACE jurisdiction are the opinions of the professionals conducting the study and are subject to confirmation by the USACE Fort Worth District.

2.0 Methods

2.1 Data Review

Qualified wetland ecologists reviewed several published data resources prior to field investigations to identify potentially jurisdictional crossings. Sources consulted included National Wetlands Inventory (NWI) maps, the National Hydrography Dataset (NHD), the Natural Resources Conservation Service (NRCS) Soil Survey for Bexar County, U.S. Geological Survey (USGS) 7.5-minute quadrangle sheets, Federal Emergency Management Agency (FEMA) floodplain maps, and recent aerial photography. Select information from this data review is shown in **Attachment A, Figures 2a-2d**.

2.2 Field Delineation

Qualified wetland ecologists conducted field investigations in May, July, and August 2019 and January and April 2020 within the proposed project area. The routine method of wetland delineation outlined in the *Field Guide for Wetland Delineation: 1987 Corps of Engineers Manual* (Wetland Training Institute [WTI] 1991) and updated in the *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Great Plains Region, Version 2.0* (USACE 2010) was utilized for wetland identifications within the project area. Field activities focused on wetlands and Waters of the U.S. delineation and description.

The *Corps of Engineers Wetlands Delineation Manual* (Environmental Laboratory 1987) defines wetlands based on three criteria: hydrophytic vegetation, hydric soils, and wetland hydrology. In general, all three criteria must be present for an area to qualify as a wetland. Some exceptions can occur in disturbed areas or in newly formed wetlands where one indicator (such as hydric soils) might be lacking. These areas would be addressed on an individual basis as outlined in the *Field Guide for Wetland Delineation* (WTI 1991) and the *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Great Plains Region, Version 2.0* (USACE 2010).

In addition to the jurisdictional wetlands defined above, the Clean Water Act (CWA) regulates impacts to other Waters of the U.S. The term “Waters of the U.S.” has broad meaning and incorporates both deepwater aquatic habitats and special aquatic sites, including wetlands, as listed below:

- The territorial seas with respect to the discharge of fill material
- Coastal and inland waters, lakes, rivers, and streams that are navigable Waters of the U.S., including their adjacent wetlands
- Tributaries to navigable Waters of the U.S., including adjacent wetlands
- Interstate waters and their tributaries, including adjacent wetlands

For linear Waters of the U.S., the ordinary high water mark (OHWM) was determined by assessing a combination of factors at each site, in accordance with Section 328.3(e) of the CWA and Regulatory Guidance Letter 05-05 (USACE December 5, 2005).

Potential water features were evaluated in the field, and localized hydrologic characteristics and the dominant vegetative species observed at the site were described. The identified Waters of the U.S. and wetland boundaries are shown in **Attachment A, Figures 3a–3bf**. Photographs of the evaluated waters and wetlands are included in **Attachment B** of this report. Water feature data forms were completed for all water features and easements with water conveyance structures. Some easements were documented in two forms, one for the westbound side and one for the eastbound side, depending on field constraints.

3.0 Results

3.1 General Description of the Project Area

3.1.1 Vicinity and Project Area

The proposed project area is located within Bexar County, Texas. The project area is in the existing Loop 1604 and I-10 transportation right-of-way. The project area also includes easements throughout the project area. The project area is urban, suburban, and undeveloped. Surrounding land use is commercial, residential, agricultural, and undeveloped.

3.1.2 Soils

Information regarding soils within the project corridor was obtained from the U.S. Department of Agriculture NRCS Soil Survey for Bexar County (NRCS 2019a), which identified twenty-three soil map units. Information on soils is included in **Table 1**. Two soil map units are listed in the *National Hydric Soils List* as containing hydric inclusions (NRCS 2015).

Table 1: Soil Map Units within the Project Area

Soil Map Unit Code	Soil Map Unit	Hydric (Yes/No)
AuB	Austin silty clay, 1 to 3 percent slopes	No
AuC	Austin silty clay, 2 to 5 percent slopes, eroded	No
BrD	Brackett gravelly clay loam, 3 to 12 percent slopes	No
BsC	Whitewright-Austin complex, 1 to 5 percent slopes	No
Ca	Anhalt clay, 0 to 2 percent slopes	No
Cb	Crawford and Bexar stony soils	No
HnB	Heiden clay, 1 to 3 percent slopes	No
HnC2	Heiden clay, 3 to 5 percent slopes, eroded	No
HoD3	Heiden-Ferris complex, 5 to 10 percent slopes, severely eroded	No
HsB	Houston Black clay, 1 to 3 percent slopes	No
HuC	Houston Black gravelly clay, 3 to 5 percent slopes	No
HuD	Houston Black gravelly clay, 5 to 8 percent slopes	No
Kr	Krum clay, 1 to 5 percent slopes	No
LvA	Lewisville silty clay, 0 to 1 percent slopes	No
LvB	Lewisville silty clay, 1 to 3 percent slopes	No
PaB	Patrick soils, 1 to 3 percent slopes, rarely flooded	No
Pt	Pits and Quarries, 1 to 90 percent slopes	No
TaB	Eckrant cobbly clay, 1 to 8 percent slopes	No
TaC	Eckrant cobbly clay, 5 to 15 percent slopes	No
TaD	Eckrant-Rock outcrop association, 8 to 30 percent slopes	No
Tb	Eddy gravelly clay loam, 1 to 8 percent slopes	No
Tc	Tinn clay, 0 to 1 percent slopes, occasionally flooded	Yes
Tf	Tinn and Frio soils, 0 to 1 percent slopes, frequently flooded	Yes

3.1.3 Hydrology

The project area is located within the Guadalupe and San Antonio River basins. The project corridor crosses French, Huesta, Leon, Salado, Panther Springs, Lorence, Mud, Elm, and Elm Waterhole Creeks and several of their tributaries, as well as tributaries to Cibolo Creek (see **Attachment A, Figures 2a-2d**).

To determine the normality of rainfall at the time of wetland field investigations, both current rainfall data and historical data were obtained from the NRCS WETS station SAN ANTONIO INTLAP, located approximately 4.5 miles south of the project area (NRCS 2019b). The recent local precipitation data is summarized in **Tables 2a-2c**, and the current condition was determined by the NRCS method (NRCS 1997). Based on these calculations, normal conditions were present during the May and August 2019 wetland investigations and wetter than normal conditions were present during the July 2019 wetland investigations. See **Attachment C** for the NRCS Climate Analysis Tables. No wetland investigations were conducted as part of the January and April 2020 field investigations.

3.1.4 Project Area Vegetation

Vegetation observed within the project area during field investigations consisted of Urban; Disturbed Prairie; Riparian; Tallgrass Prairie, Grassland; and Edwards Plateau Savanna, Woodland, and Shrubland habitat types. Additional documentation of the project area vegetation is included in the Biological Evaluation Form and Tier 1 Site Assessment Form and their Supplemental Attachments, provided under separate cover.

3.2 Section 404 of the Clean Water Act

3.2.1 Water Features Evaluated

Thirty-one crossings, comprised of 35 water features and two wetlands, were identified within the project area during field investigations. These water features include: French, Huesta, Leon, Salado, Panther Springs, Lorence, Mud, Elm, and Elm Waterhole Creeks, unnamed tributaries to these creeks, and unnamed tributaries to Cibolo Creek.

A majority of the streams are ephemeral, although a few may be intermittent, meaning the primary source of water is supplied by groundwater with supplemental flow from rainwater runoff, and the presence of flowing water varies temporally. None of the identified features are perennial within the proposed project area. See **Section 3.2.2** below for the USACE definitions of the three types of streams.

The majority of the creeks pass through the right-of-way and under Loop 1604 enclosed in culverts (typically concrete boxes) that extend from outside the frontage road across the right-of-way to the outside of the opposite frontage road. The majority of the stream beds are contained within the concrete culverts and aprons, except for small portions on each end of the culverts. The non-culverted portions of the stream represent a small area that could be impacted by the proposed project. The larger creeks and tributaries identified along the corridor pass through the right-of-way underneath a series of frontage road and mainlane bridges. The stream bottoms are typically gravelly deposits or grass. Two emergent wetlands were identified within the proposed project area, in association with streams.

There are existing easements located upstream and/or downstream at many of the crossings. The easements are largely undeveloped and contain unaltered meandering flow of the streams.

All of the creeks and tributaries flow to traditionally navigable waters. They are depicted on **Figures 2a-2d** and **3a-3bf** in **Attachment A**. Photographs of the features and points where wetland determination forms were completed are included in **Attachment B**, the wetland determination forms are included in **Attachment D**, water feature data forms are included in **Attachment E**, and a schematic overlay of Waters of the U.S. is shown in **Attachment F**. Detailed descriptions of the water features are included in **Attachment G** and are summarized in **Table 3**.

3.2.2 Streams

Table 3 indicates the streams that would be directly or indirectly impacted by the proposed project. The USACE describes three different types of jurisdictional streams:

- Ephemeral stream: Primary source of water for these features is rainwater runoff. The water table is located below the stream bed. Flowing water is present only during and for a short time after precipitation events.
- Intermittent: Primary source of water is supplied by groundwater with supplemental flow from rainwater runoff. Presence of flowing water varies temporally.
- Perennial: Primary source of water is supplied by groundwater with supplemental flow from rainwater runoff. The water table is located above the stream bed. Flowing water is present year-round.

Streams were designated as intermittent if water was present during at least one of the 2019 field visits and were determined to be ephemeral if no water was present during any of the field visits. The 2020 field visits were conducted following large rainfall events and therefore

were not considered in the determination of stream categorization. No perennial streams were identified in the project area.

Table 3: Water Features in the Project Area

	Crossing Number	Water Feature Name	Easement Number	Type	Existing ROW Structures	Direct Impacts	Indirect Impacts

¹ These water features are subject to Section 404 of the CWA. None of the features are subject to the Wild and Scenic Rivers Act of 1968 or the Rivers and Harbors Act (RHA) of 1899.

² Indirect impacts would be reasonably foreseeable in downstream extents of streams crossed by the project. See Section 3.2.5 Indirect Impacts to Streams.

³ Temporary and/or permanent direct impacts would occur. See Section 3.2.3 Direct Impacts to Streams.

3.2.3 Direct Impacts to Streams

Under implementation of the proposed project, direct impacts to streams include the discharge of dredge or fill material (**Table 4**).

Table 4: Direct Impacts to Streams

Water Feature	Project Activity	Temporary and Permanent Direct Impacts
Crossing 1, Water 1	<ul style="list-style-type: none"> Sidewalk construction 	<ul style="list-style-type: none"> Temporary discharge of dredge or fill from construction access and construction activities in the channel bottom. Permanent impacts would be avoided to the greatest extent practicable.
Crossing 2, French Creek	<ul style="list-style-type: none"> Culvert conversion to a bridge (open channel) structure 	<ul style="list-style-type: none"> Temporary discharge of materials during the removal of the existing culvert and adjacent grading of the proposed channel's side slopes. Permanent impacts would be avoided within the footprint of the existing culvert. The flow line of the proposed channel is anticipated to be the same as the existing culvert flow line, and no permanent grading of the OHWM is anticipated within the footprint of the existing culvert. Due to the conversion of culvert to open-stream channel, the condition of the channel would be improved at the completion of construction.
Crossing 3, Water 2	<ul style="list-style-type: none"> Sidewalk construction Addition of one box culvert to the existing culvert 	<ul style="list-style-type: none"> Temporary discharge of dredge or fill from construction access and construction activities in the channel bottom. Permanent impacts would be avoided to the greatest extent practicable.

Water Feature	Project Activity	Temporary and Permanent Direct Impacts
Crossing 4, Water 3	<ul style="list-style-type: none"> • Culvert Improvements 	<ul style="list-style-type: none"> • Temporary discharge of dredge or fill from construction access and construction activities in the channel bottom. • No permanent impacts anticipated.
Crossing 4, Water 4	<ul style="list-style-type: none"> • Culvert improvements (upsized) 	<ul style="list-style-type: none"> • Temporary discharge of dredge or fill from construction access and construction activities in the channel bottom. • Temporary discharge during culvert improvements. • No permanent impacts anticipated.
Crossing 5, Huesta Creek	<ul style="list-style-type: none"> • Widen bridge between proposed mainlanes and frontage roads. • Bridge piers would be poured 	<ul style="list-style-type: none"> • Temporary discharge of dredge or fill from construction access and construction activities in the channel bottom. • Permanent impacts would be avoided to the greatest extent practicable. Streambed is ephemeral and limited aquatic habitat is present.
Crossing 6, Water 5	<ul style="list-style-type: none"> • Lateral culvert outfall at existing headwall 	<ul style="list-style-type: none"> • Temporary discharge of dredge or fill from construction access and construction activities in the channel bottom. • No permanent impacts anticipated.
Crossing 7, Water 6	<ul style="list-style-type: none"> • Lateral culvert outfalls within existing culvert and at existing headwall 	<ul style="list-style-type: none"> • Temporary discharge of dredge or fill from construction access and construction activities in the channel bottom. • Temporary discharge associated with lateral culvert outfall within existing culvert. • No permanent impacts anticipated.
Crossing 8, Water 7 and Water 8	<ul style="list-style-type: none"> • Widen bridge between proposed mainlanes and frontage roads • Bridge piers would be poured 	<ul style="list-style-type: none"> • Temporary discharge of dredge or fill from construction access and construction activities in the channel bottom. • Permanent impacts to Water 7 would be avoided to the greatest extent practicable. Streambed is ephemeral and limited aquatic habitat is present. • No permanent impacts to Water 8 would occur.
Crossing 9, Water 9	<ul style="list-style-type: none"> • Sidewalk construction • Lateral culvert outfalls within existing culvert 	<ul style="list-style-type: none"> • Temporary discharge of dredge or fill from construction access and construction activities in the channel bottom. • Temporary discharge associated with lateral culvert outfall within existing culvert. • Permanent impacts would be avoided to the greatest extent practicable. Streambed is ephemeral and limited aquatic habitat is present.
Crossing 12, Leon Creek	<ul style="list-style-type: none"> • Widen bridge between proposed mainlanes and frontage roads • Bridge piers would be poured 	<ul style="list-style-type: none"> • Temporary discharge of dredge or fill from construction access and construction activities in the channel bottom. • Permanent impacts would be avoided to the greatest extent practicable. Streambed is ephemeral and limited aquatic habitat is present.

Water Feature	Project Activity	Temporary and Permanent Direct Impacts
Crossing 13, Leon Creek	<ul style="list-style-type: none"> • Complete replacement of mainlane and westbound frontage road bridges • Bridge piers would be poured 	<ul style="list-style-type: none"> • Temporary discharge of dredge or fill from construction access and construction activities in the channel bottom. • Permanent impacts would be avoided to the greatest extent practicable. Streambed is ephemeral and limited aquatic habitat is present.
Crossing 14, Leon Creek	<ul style="list-style-type: none"> • Widen bridge between proposed mainlanes and frontage roads • Bridge piers would be poured 	<ul style="list-style-type: none"> • Temporary discharge of dredge or fill from construction access and construction activities in the channel bottom. • Permanent impacts would be avoided to the greatest extent practicable. Any temporary fill that results from the proposed project would be removed entirely. If construction activities result in alterations to stream morphology below the OHWM, preconstruction contours would be restored. Based on the direct impacts described above, **Table 5** provides the USACE Section 404 permitting requirements for the proposed project.

Table 5: USACE Section 404 Permitting Requirements

Crossing Number	Water Feature	Activity	Permanent Loss of Waters of the U.S. (acres/linear feet)	Temporary Impacts of Waters of the U.S. (acres)	Section 404 Permit Requirement
Crossing 1	Water 1 – Tributary to French Creek	See Table 4	0.00502 acre/ 20 linear feet	0.015983 acre/ 176 linear feet	NWP 14, no PCN

Based on the available project information and the results of field investigations, it is expected that the proposed activities would qualify for authorization under Nationwide Permit (NWP) 14, without Preconstruction Notification (PCN) to the USACE.

The proposed project would expand and modify the linear transportation facility along Loop 1604 from SH 16 to I-35. TxDOT would take appropriate measures to maintain normal downstream flows and to minimize flooding. Temporary fills would consist of construction-related materials and would be placed in a manner that would not be eroded by expected high flows. TxDOT would remove temporary fills in their entirety upon the completion of construction, and the affected area would be returned to preconstruction elevations and would be revegetated, as appropriate. Most of the temporary discharges of dredge or fill material would be associated with drilling shafts for bridges and would be in place for short

duration. TxDOT would avoid permanent and temporary discharge of dredge or fill material in any wetland. Temporary impacts to streams were calculated using the following methodology:

- For bridged features, the entire stream channels and wetlands within the proposed right-of-way are considered subject to temporary impacts.
- For culverted features, all channels within 100 feet of permanent construction are considered subject to temporary impacts.
- For Crossings 2 and 3, where improvements to the culvert and culverted portion of the feature are proposed, a 100-foot buffer around the existing culverts is considered subject to temporary impacts.
- For outfalls (i.e., connections) between proposed lateral culverts and existing culverts, temporary discharge was assumed within an area five feet upstream and downstream of the outfall. For proposed outfalls in existing headwalls, temporary discharge was assumed within an area 100 feet from the proposed outfall.

The proposed project would comply with the NWP general and regional conditions applicable to NWP 14. The activities at each individual crossing have been identified as single and complete projects, as defined in the nationwide permit program. As such, each impacted crossing would be permitted under a separate NWP.

3.2.4 Outfalls for Stormwater Management Facilities

Several outfalls would be necessary to drain stormwater management facilities, such as in-line detention. Best Management Practices (BMPs) would be implemented to control total suspended solids (TSS). The stormwater management facilities shown on the schematic are subject to change when the detailed design is determined. The construction of outfalls may involve direct and indirect impacts to streams.

Outfalls (typically concrete pipes) would likely tie into the sides of existing box culverts. In these cases, no permanent loss of waters would result because the outfalls already have concrete bottoms. However, temporary discharges of fill may occur. If outfalls are required in the banks of natural-substrate channels, temporary discharges of dredge or fill and a minor permanent loss of Waters of the U.S. may result. During detailed design, outfall velocities would be calculated; if they are erosive, minor amounts of concrete lining may be required around the outfall, thereby resulting in minor losses of Waters of the U.S. Each outfall would be authorized by an NWP, such as NWP 14 or NWP 18 – *Minor Discharges*.

Based on the current level of design, PCNs are not expected to be required to obtain permit coverage under NWP 14. Impacts resulting from any pending outfall elements (discussed above) are anticipated to be authorized by a nationwide permit without a need for a PCN. The terms and conditions of each NWP required to construct the project would be implemented. In addition, Texas Commission on Environmental Quality (TCEQ)-approved erosion, sedimentation, and post-construction TSS controls would be utilized in accordance with the TCEQ's Section 401 Certification Conditions for each NWP. During the detailed design and construction phase, project activities would be regularly evaluated to determine the appropriate permitting under Section 404 of the CWA.

3.2.5 Indirect Impacts to Streams

The primary indirect impacts to streams pertain to how runoff characteristics would change during the construction phase and during the operation and maintenance (i.e., post-construction phase) of the completed facility. The streams within the TxDOT right-of-way and downstream of the TxDOT right-of-way would experience indirect effects of work in the right-of-way.

For this analysis, runoff characteristics are divided into two categories:

- Quantity impacts
- Quality impacts

Quantity Impacts to Streams

Examples of quantity impacts that may result from a new highway or the modification of an existing highway are shown in **Table 6** (American Association of State Highway and Transportation Officials [AASHTO] 1999). Some of these impact types are applicable to the proposed project, but others are not. A project-specific analysis is presented in **Table 6**.

Table 6: Quantity Impacts to Streams

Examples of Quantity Impacts (AASHTO 1999)	Project Impacts and Mitigation
An increase or decrease in the existing peak and volume of runoff into receiving waters.	The proposed project would add impervious cover, which would increase runoff and peak flows. Detention of approximately 70.88 acre-feet would be required to mitigate peak flow and runoff volume impacts. This volume is proposed to be provided within TxDOT right-of-way in the form of in-line ditch detention systems, as shown on the schematic (TxDOT 2020a).
The storage volume in lake, reservoir, and wetland areas may be reduced. Conversely, permanent impoundments created by highways can increase storage volumes.	No lakes or reservoirs are located within the project construction limits (PCL). Therefore, none would be impacted under implementation of the proposed project. Wetlands are located in the PCL. However, their storage volumes would not be impacted by the proposed project. Floodplain volume impacts and mitigation are summarized in Section 3.5 - Floodplains.
Channel modifications may increase or decrease the quantity of stream length, and the highway's geometrical and pavement features may change the quantity of runoff reaching the channel.	The proposed project would not alter the length of any streams. Increased pavement may affect runoff quantity.
Cross-drainage structures may decrease the peak discharge downstream from a highway by temporarily impounding stormwater runoff.	Peak flow and runoff volume impacts and mitigation are summarized above and presented in detail in the project's drainage study (TxDOT 2020a).
Storm drains may increase a stream's peak discharge.	Storm drains and outfalls would be needed to accommodate stormwater management facilities. These conveyances would be determined during the detailed design phase. Section 3.2.3 - Outfalls for Stormwater Management Facilities provides additional details.

If not mitigated, the proposed project’s surface water quantity impacts may result in the following:

- Erosion of the bed and banks of streams and deposition of eroded materials downstream, involving the following receptors:
 - Ephemeral and intermittent stream habitats
 - Wetland habitats
 - Recharge areas for the Edwards Aquifer

Changes in flow characteristics have been evaluated consistent with a schematic level of effort. During the detailed design phase, these characteristics would be re-examined to ensure all applicable standards and commitments are achieved.

Quality Impacts to Streams

Examples of quality impacts that may result from a new highway or the modification of an existing highway are shown in **Table 7** (AASHTO 1999). Some of these impact types are applicable to the proposed project, while others are not. A project-specific analysis is presented in **Table 7**.

Table 7: Quality Impacts to Streams

	Examples of Quality Impacts	Project-Specific Analysis and Mitigation
	Changes in sediment bed load transportation and deposition can impact spawning grounds. Turbidity can cause mortality in fish.	Under implementation of the proposed project, there is limited potential for this impact mechanism because there is minimal aquatic habitat in receiving streams. Since peak flow and runoff volume impacts would be mitigated, no long-term sediment transport impacts are anticipated. However, there is the potential for short-term impacts during construction (See Construction-Phase Impacts to Streams subsection below).
	Other pollutants may adhere to sediment particles and cause toxicity to fish and other aquatic species.	In order to protect surface water and groundwater quality, TCEQ has established requirements for TSS loadings as a surrogate for other pollutants (See Post-Construction-Phase Impacts to Streams subsection below).
	Water quality may affect the visual quality (i.e., color, smell, appearance, accessibility, and suitability for contact recreation) of surface waters.	Under implementation of the proposed project, there is limited potential for this impact mechanism because there is no persistent water column in most of the project area.

3.2.6 Construction-Phase Impacts to Streams

Construction-phase impacts are generally short-term impacts that coincide with the reconstruction of the facility from its existing condition to the proposed project. The project’s construction phase would involve the removal of grass that stabilizes the soil and the subsequent excavation of rock and soils. Particulates would be generated by the removal of existing infrastructure (e.g., milling pavement, saw-cutting, and breaking concrete structures). The project would also require importing materials for construction such as earthen fill,

aggregates, asphalt, concrete, concrete curing compounds, and asphalt binders. Many of these materials would be stockpiled on site. The earthen materials would be subject to erosion by wind and rain, which can carry sediments into receiving waters.

Aquatic habitats located downstream of the construction disturbance could experience short-term increases in turbidity or deposition, which can be harmful to aquatic life. Any impacts to aquatic habitats would result from the combined effects of the project's runoff and runoff from the remainder of the upstream watershed.

Several environmental permits would be required for the proposed project and contain provisions for managing potential pollutants during the construction phase. These include the following:

- NWPs contain provisions for use of appropriate erosion and sedimentation controls. The TCEQ's Section 401 *Certification Conditions for Nationwide Permits* requires that specific TCEQ-approved controls be used in conjunction with NWPs.
- A Construction General Permit (CGP) under the Texas Pollutant Discharge Elimination System's (TPDES) permit program would be required. Since the project would disturb more than five acres of soil, a Notice of Intent (NOI) would be filed with the TCEQ to obtain permit coverage. A Storm Water Pollution Prevention Plan (SW3P) would be prepared and implemented. The SW3P would outline BMPs that would be used during construction to minimize erosion and offsite sedimentation and minimize other constituents from traveling offsite through stormwater. Construction BMPs may include temporary vegetation, blankets/matting, mulch, and sod for erosion control and silt fences and rock berms for sedimentation control. The BMPs would be implemented prior to construction and would be inspected and maintained throughout construction.

Additional construction-related BMPs appropriate for the project include:

- Remove temporary dredge or fill from streambeds promptly, before rain events
- Maintain perimeter erosion controls around stockpiles
- Washout concrete trucks in designated washout pits
- Promptly stabilize areas to minimize the soil disturbed at any given time
- An Edwards Aquifer Water Pollution Abatement Plan (WPAP) would be prepared for the proposed project. One component of the WPAP is a Temporary Stormwater Section, which includes requirements for erosion and sediment control during construction and requires additional information regarding sensitive features.

In addition to the project-specific permits discussed above, TxDOT's Municipal Separate Storm Sewer System (MS4) Permit is applicable to activities conducted within the limits of an MS4. The proposed project is within the limits and would drain to the City of San Antonio MS4, which also contains provisions for management of construction sites.

TxDOT's Environmental Management System is intended to improve communication of environmental permits, issues, and commitments (EPICs) throughout the planning, detailed design, and construction of a project. TxDOT has specific requirements for contractor education on stormwater management topics.

3.2.7 Post-Construction-Phase Impacts to Streams

The proposed project would add approximately 198 acres of additional impervious cover over the Edwards Aquifer Recharge Zone and 3 acres over the Contributing Zone of the Edwards Aquifer (TxDOT 2020b).

Impervious cover prevents rain from seeping into the ground and thereby reduces natural soil infiltration. Stormwater runoff from parking lots, highways, roof tops, yards, sidewalks, and other impervious surfaces contains suspended solids, pesticides, bacteria, petroleum residues (i.e., oil and grease), fertilizers, animal waste, and metals (Texas Register [TexReg] 1998).

The TCEQ adopted the Edwards Aquifer Rules (30 Texas Administrative Code [TAC] 213) for the specific purpose of regulating activities that have the potential to pollute the Edwards Aquifer and hydrologically connected surface water to protect existing and potential uses of groundwater and to maintain Texas Surface Water Quality Standards (TexReg 1998). The proposed project and associated activities would comply with the Edwards Aquifer rules and any applicable TCEQ guidance documents.

The proposed project would be subject to 30 TAC 213 and would require treatment of runoff. Mitigation measures would be designed, constructed, operated, and maintained to ensure that 80 percent of the incremental increase in the annual mass loading of TSS from the site caused by the regulated activity is removed. TSS does not provide a complete assessment of water quality issues associated with stormwater. However, it serves as a good indicator of significant pollutants of concern, such as oil and grease, and water quality in general. TSS correlates with other water quality constituents, including but not limited to, oil and grease (TexReg 1998).

A combination of BMPs were selected as the desirable BMPs for the project for numerous reasons (TxDOT 2020b). Vegetative filter strips, grassy swales, concrete-walled sediment-filtration ponds and batched detention basins are considered to be the preferred treatment method. Earthen-walled basins were not considered during this analysis, as they would have a larger footprint and require more maintenance than concrete basins.

Due to their high removal efficiency and relatively low cost, vegetative filter strips would be utilized wherever possible along the frontage roads and ramps by providing 15-foot-wide, 5:1 side slopes adjacent to the new pavement edges. Grassy swales would also be included in areas where space is available for wide and flat ditches (<0.5 percent grade) that could achieve the required removal rates.

Water quality sand filter ponds would be added in open areas within the right-of-way. They would be sized to treat as much of the required area as possible, within the available space provided. In some instances, the ponds would not be sized for optimal efficiency, but would still provide as much treatment as needed to meet the TSS removal requirements. In most cases, 5-foot deep ponds would be used. Outfall elevations would be verified by comparing the cross-culvert flowline with the proposed outfall at the pond.

In areas where space would be limited, underground wet vaults would be proposed along the storm sewer system and may include proprietary devices such as Baysaver and StormFilter. It will be up to the Plans, Specifications, and Estimates (PS&E) designer to determine the water quality device to use for the project. For the schematic design analysis, wet vaults would be proposed in tight areas because of their small footprint and high efficiency.

Removing TSS may not remove dissolved constituents such as nitrogen and phosphorous (i.e., nutrients found in fertilizers). TxDOT uses fertilizers to vegetate and stabilize soils at the completion of construction but does not use fertilizer as part of ongoing operation and maintenance. Therefore, the proposed project would not represent a long-term source of nutrient loads to receiving waters.

3.2.8 Water Pollution Abatement Plan

As stated above, impervious cover would increase over the EARZ and the EACZ. For this reason, it is anticipated that the project would require the preparation and implementation of an Edwards Aquifer WPAP. The WPAP would include a plan for the operation and maintenance of BMPs.

The details on TSS removal BMP types, sizes, and locations would be determined during the detailed design phase of the project. These details would be presented in an Edwards Aquifer WPAP and would be subject to TCEQ review and approval before construction may commence.

3.2.9 Hazardous Materials Spills

Hazardous materials spills have the potential to pollute surface water and groundwater. Hazardous materials are used at a variety of facilities in the watershed, such as gas stations, manufacturing facilities, and service facilities. The hazardous materials initial site assessment prepared for this project contains additional information on the private and public facilities that utilize hazardous materials in the project area.

In the highway environment, hazardous materials include gasoline and diesel in vehicles' fuel tanks and a variety of solid, liquid, and gaseous materials are transported on highways as cargo. Similarly, underground sanitary sewer lines that cross the landscape carry wastewater from developments in the watershed. These materials pose a risk to water quality if released to the environment.

Hazardous materials spills may result

- from use of the existing facility;

- during the project’s construction phase; or
- after the proposed project is complete.

The Non-Radioactive Hazardous Materials (NRHM) Route Plan prohibits the use of Loop 1604 for through-transport of hazardous materials; however, I-10 within the project area is identified as a hazardous materials route (TxDOT 2019).

TxDOT maintains a contract with an emergency hazardous materials response company to respond to spills as needed (e.g., in the case where the party responsible for the spill is not responsive in procuring their own clean-up company).

During construction, traffic would continue to use the facility as a route for hazardous materials transport and pose a risk of spills. The construction activity itself temporarily changes the risk scenario. Hazardous materials are used in roadway construction and include fuel for equipment, asphalt emulsions, concrete additives, and curing compounds. To help reduce the risk of spills that could affect water resources, TxDOT has specific restrictions and requirements the contractor must follow during construction, including the following:

- TxDOT would not allow hazardous materials storage on TxDOT right-of-way within the EARZ.
- The construction contractor would be responsible for the response, clean-up, and notification of any spills related to construction.
- Following construction, traffic would continue to use the facility and pose a risk of spills. The Edwards Aquifer WPAP would describe the measures that would be used to contain any spill of hydrocarbons or hazardous substances such as on a roadway (TexReg 1998).

All of the hard-structure water quality control measures would provide spill control with valves included on the downstream side. The proposed facility would be operated in accordance with the Hazardous Materials Route Plan, the Edwards Aquifer WPAP, and the MS4 Permit.

3.2.10 Wetlands

Two wetlands (Wetlands 1 and 2) were identified in the PCL as part of this study (**Table 8**). The wetlands are connected to streams that are Waters of the U.S. and are therefore assumed jurisdictional.

Table 8: Wetlands

Crossing Number	Water Feature	Location	Type	Acreage within the Project Area	Direct Impacts	Indirect Impacts
Crossing 15	Wetland 1	Leon Creek within right-of-way	Emergent	0.023	No	Altered hydology
Crossing 17	Wetland 2	E14 SB	Emergent	0.004	No	Altered hydology

Detailed descriptions of the wetlands are provided below:

- Wetland 1 is a non-forested emergent wetland located underneath the Loop 1604 west bound bridge at Leon Creek. This wetland connects to Leon Creek within the project area. Dominant vegetation includes green ash (*Fraxinus pennsylvanica*), swamp smartweed (*Persicaria hydropiperoides*), and green flatsedge (*Cyperus virens*).
- Wetland 2 is non-forested emergent wetland located on the west side of I-10 within Easement 14. This wetland is adjacent and connects to Water 14. Dominant vegetation includes black willow (*Salix nigra*), Vasey grass (*Paspalum urvillei*), and western umbrella-sedge (*Fuirena simplex*).

Temporary and permanent impacts to both wetlands would be avoided. Special care will be required to avoid impacts to Wetland 1 due to its proximity to permanent construction. The wetlands are not anticipated to experience indirect effects such as those described in Section 3.2.4 - *Indirect Impacts to Streams*. The mitigation plans for streams would also protect wetlands.

Both wetlands may be indirectly affected through subtle alterations in project area hydrology.

3.3 Section 401 of the Clean Water Act

Erosion control, sediment control, and post-construction TSS controls would be incorporated into the construction plan to provide for the protection of surface water quality.

3.4 Navigable Waters

No navigable waterways pursuant to Section 9 or Section 10 of the RHA or the General Bridge Act are located within the proposed project area.

3.5 Floodplains

The project is in Bexar County, which is a participant in the National Flood Insurance Program. According to the FEMA Flood Insurance Rate Map (FIRM) Community Panel Numbers 48029C0220G, 48029C0210G, 48029C0230G, 48029C0235G, 48029C0255G, 48029C0260G, and 48029C0280F (FEMA 2019), the project intersects the FEMA-designated 100-year floodplains associated with French Creek, Huesta Creek, Leon Creek, Salado Creek, Panther Springs Creek, Lorence Creek, Mud Creek, Elm Creek, Elm Waterhole Creek, and unnamed tributaries to these creeks, as well as with unnamed tributaries to Cibolo Creek (see **Attachment A, Figures 2a-2d**).

The project would require the placement of fill in some portions of the floodplain and the removal of earth materials from the floodplain in other areas. At Loop 1604 and French Creek (Crossing 2) and at I-10 and Leon Creek (Crossing 13) portions of the roadways overtop during some storm events. Replacement bridges would be constructed in these areas accompanied by the removal of fill from the floodplain. Detailed cut and fill calculations for the PCL have not been performed yet. FEMA regulations require that fill in the 100-year floodplain be compensated with an equal amount of cut below the 100-year floodplain elevation in an area with flow connectivity to the main channel floodplain. The floodplain fill compensation would

be accommodated within the right-of-way. Coordination with the local floodplain administrator would be required.

The hydraulic design for this project would be in accordance with current Federal Highway Administration and TxDOT design policies. The facility would permit the conveyance of the 100-year flood, inundation of the roadway being acceptable, without causing significant damage to the facility, stream, or other property. The proposed project would not increase the base flood elevation to a level that would violate applicable floodplain regulations and ordinances.

The proposed action may be considered a significant encroachment on the floodplain as defined by 23 Code of Federal Regulations (CFR) 650.105. Therefore, it is necessary to demonstrate that the significant encroachment is the only practicable alternative. The following support documentation would be required:

- The reasons why the proposed action must be in the floodplain
- The alternatives considered and why they were not practicable
- A statement indicating whether the action conforms to applicable state or local floodplain protection standards.

The existing alignment of Loop 1604 is located within the FEMA-mapped floodplains. There are no alternative transportation corridors of similar functional class connecting Loop 1604 at SH 16 to I-35 that would avoid floodplains. Designs that utilize the existing right-of-way and mitigate for floodplain impacts would be practicable. The project would be designed to conform with applicable state and local floodplain protection standards. Based on this information, an encroachment on a floodplain would be the only practicable alternative.

3.5.1 Executive Order – Floodplain Management (EO 11988)

Executive Order (EO) 11988 directs each federal agency to act to reduce the risk of losses associated with floods, to minimize the impact of floods on human health and safety, and to preserve the beneficial values of floodplains. Compliance with EO 11988 is addressed programmatically through the implementation of the TxDOT Hydraulic Design Manual, which includes notification and coordination with local floodplain administrators.

3.6 Water Quality

3.6.1 Section 303(d) of the Clean Water Act

The project area is located within the Leon Creek, San Antonio River, Salado Creek, and Upper Cibolo Creek watersheds within the San Antonio River Basin. For the purposes of monitoring water quality, the TCEQ has divided the major water bodies within the San Antonio River Basin into 13 discrete segments. Water runoff from the project area is within five stream miles of and drains to two impaired stream segments: Segment 1908_03 – Upper Cibolo Creek and Segment 1906_06 – Leon Creek. Segment 1908_03 is listed as impaired for chloride and Segment 1906_06 is listed as impaired due to polychlorinated biphenyls (PCBs) in edible

tissue. The PCBs are associated with land use around former Kelly Air Force Base, approximately 13 miles downstream of the project. The proposed project is not expected to contribute to the constituents of concern for the impaired units. The TCEQ 2018 303(d) list, approved on December 23, 2019, was utilized in this assessment (TCEQ 2018). Coordination with the TCEQ is required. See **Attachment A, Figure 4**.

3.6.2 Section 402 of the Clean Water Act: Texas Pollutant Discharge Elimination System

The proposed project would include five or more acres of earth disturbance. TxDOT would comply with the TCEQ's TPDES CGP. Efforts would be made to avoid and minimize impacts to the aquatic ecosystem during roadway design. Minimization would be achieved by preparing and implementing a SW3P and by implementing BMPs, including temporary erosion, sedimentation, and TSS water pollution controls. All temporary erosion controls would follow TxDOT Standard Specifications and would be in place, according to the construction plans, prior to commencement of construction-related activities. The contractor would take appropriate measures to prevent, minimize, and control the spill of fuels, lubricants, and hazardous materials in the construction staging areas. A construction site notice would be posted. An NOI and Notice of Termination would be required.

3.6.3 Section 402 of the Clean Water Act: Municipal Separate Storm Sewer System

The project area lies within an MS4 area. Since TPDES CGP authorization and compliance (and the associated documentation) occur outside the environmental clearance process, compliance is ensured by the policies and procedures that govern the design and construction phases of projects. The Project Development Process Manual and PS&E Preparation Manual require a SW3P be included in the plans of all projects that disturb one or more acres. The Construction Contract Administration Manual requires that the appropriate CGP authorization documents (NOI or site notice) be completed, posted, and submitted, when required by the CGP, to TCEQ and the MS4 operator. It also requires that projects be inspected to ensure compliance with the CGP.

The PS&E Preparation Manual requires that all projects include Standard Specification Item 506 (Temporary Erosion, Sedimentation, and Environmental Controls), and the "Required Specification Checklists" require Special Provision 506-003 on all projects that need authorization under the CGP. These documents require the project contractor to comply with the CGP and SW3P and to complete the appropriate authorization documents.

3.7 Executive Order 11990, Wetlands

EO 11990, Protection of Wetlands (issued in 1977), requires federal agencies to minimize the destruction or modification of wetlands. Two wetlands were identified within the proposed project area. No permanent impacts to wetlands are anticipated.

3.8 Texas Coastal Management Program

The project is located within Bexar County, which is located outside the Coastal Zone Boundary. No coordination would be required.

3.9 Coastal Barrier Resources Act

The Coastal Barrier Resources Act (CBRA) was enacted in 1982 to discourage development in certain coastal areas along the Atlantic and Gulf coasts. The act designated certain undeveloped coastal areas as coastal barrier/system units under the Coastal Barrier Resources System (CBRS) and made those units ineligible for most new federal expenditures and financial assistance.

The proposed project is located within Bexar County and is not located within a CBRS unit or otherwise protected area; therefore, CBRA is not applicable.

3.10 Wild and Scenic Rivers

The proposed project would not involve work within a segment of any river designated as a Wild and Scenic River, and it would not harm the free-flowing condition, water quality, or outstanding resource values of any designated Wild and Scenic Rivers.

3.11 Groundwater

3.11.1 Edwards Aquifer

The Edwards Aquifer is the most productive and most regulated of the aquifers within the project area. Collectively, the Georgetown, Person, and Kainer Formations (a.k.a. Edwards limestones) are the host rocks for the Edwards Aquifer. Where the Edwards limestones are exposed at the surface, the karst terrain is characterized by the presence of sinkholes, sinking (losing) streams, and caves. Underground, water moves through highly permeable fractures and voids, which results in prolific wells but also reduces the aquifer's ability to filter potential contaminants. This characteristic makes the aquifer's water quality highly dependent on the quality of surface water flowing over the recharge zone. The project would maintain compliance with the Edwards Aquifer rules by submitting an Edwards Aquifer WPAP prior to construction. The studies for this project include more detailed engineering and environmental reports on groundwater with an emphasis on the Edwards Aquifer.

Exhibit 1 shows the zones of the Edwards Aquifer.

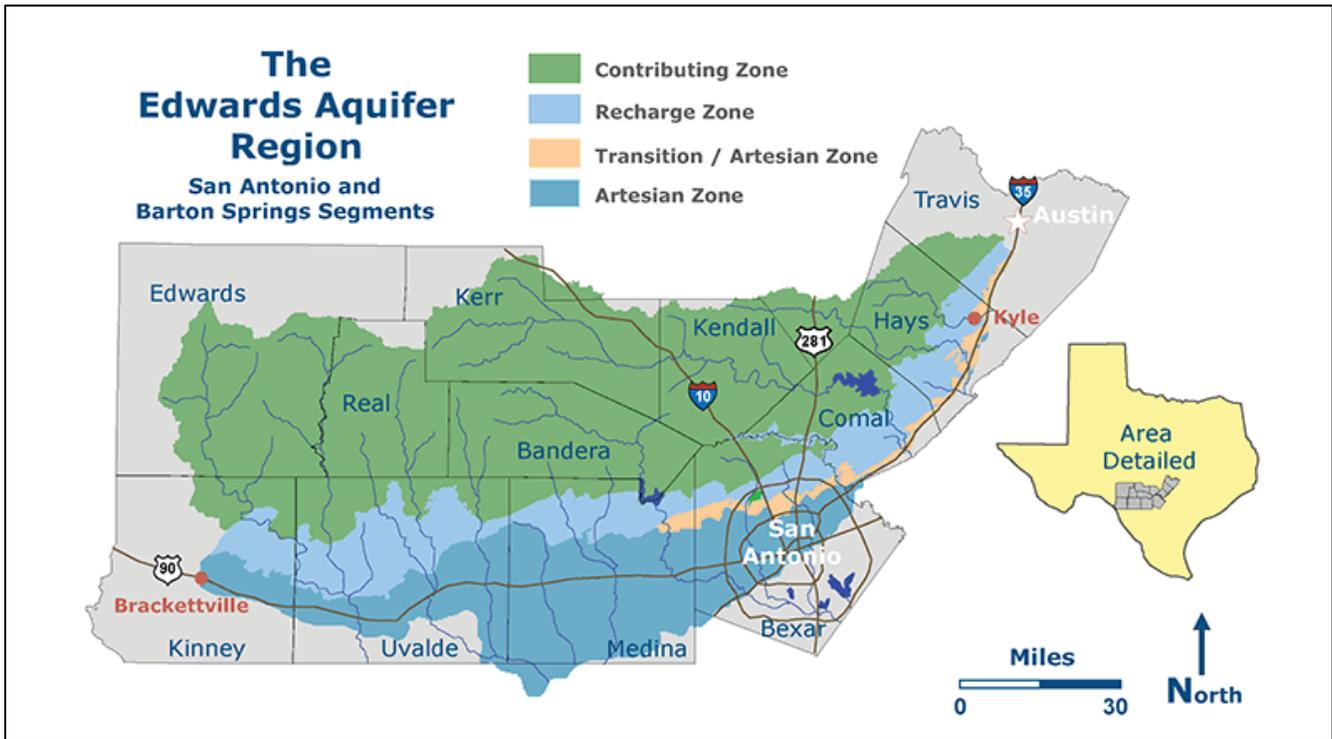

Exhibit 1: Edwards Aquifer Zones

3.12 International Boundary and Water Commission

The project would not be located within the floodplain of any international waters; therefore, coordination with the International Boundary and Water Commission would not be required.

4.0 Conclusions

Thirty-one crossings, comprised of 35 water features and two wetlands, were identified within the project limits. These water features include: French, Huesta, Leon, Salado, Panther Springs, Lorence, Mud, Elm, and Elm Waterhole Creeks, unnamed tributaries to these creeks, and unnamed tributaries to Cibolo Creek. It is anticipated that impacts would be permitted under NWP 14 without PCN to the USACE for Crossings 1, 2, 3, 4, 5, 6, 7, 8, 9, 12, 13, 14, 15, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, and 31. The project would be required to apply for authorization under the CGP. As such, completion and implementation of a SW3P, filing of an NOI with TCEQ, and posting of a site notice would be required.

An NOI would be submitted to the local MS4 operator, and possible floodplain impacts would be coordinated through the local floodplain administrator.

Permits for the proposed project would include the completion of an Edwards Aquifer WPAP for submittal to TCEQ for review and approval.

GROWING SEASON DATES

Years with missing data:	24 deg = 1	28 deg = 1	32 deg = 0
Years with no occurrence:	24 deg = 20	28 deg = 2	32 deg = 0
Data years used:	24 deg = 48	28 deg = 48	32 deg = 49
Probability	24 F or higher	28 F or higher	32 F or higher
50 percent *	1/4 to 1/21: 382 days	1/31 to 12/16: 319 days	2/26 to 11/28: 275 days
70 percent *	No occurrence	1/22 to 12/25: 337 days	2/20 to 12/4: 287 days

* Percent chance of the growing season occurring between the Beginning and Ending dates.

Notes: Data missing in any month have an "M" flag. A "T" indicates a trace of precipitation.

Data missing for all days in a month or year is blank.

Creation date: 2016-07-22

Attachment D
Wetland Determination Data Forms

WETLAND DETERMINATION DATA FORM – Great Plains Region

Project/Site: Loop 1604 from SH 16 to I-35 City/County: Bexar County Sampling Date: 07.31.2019
 Applicant/Owner: TxDOT State: TX Sampling Point: WDP1_AB_7.31
 Investigator(s): Walt Meitzen, Austin Blase Section, Township, Range: N/A
 Landform (hillslope, terrace, etc.): Terrace Local relief (concave, convex, none): Concave Slope (%): 0-2
 Subregion (LRR): LRR I Lat: 29.58795132 Long: -98.60089022 Datum: NAD 83
 Soil Map Unit Name: Tf - Tinn and Frio soils, 0 to 1 percent slopes, frequently flooded NWI classification: None

Are climatic / hydrologic conditions on the site typical for this time of year? Yes _____ No (If no, explain in Remarks.)
 Are Vegetation _____, Soil _____, or Hydrology _____ significantly disturbed? Are "Normal Circumstances" present? Yes No _____
 Are Vegetation _____, Soil _____, or Hydrology _____ naturally problematic? (If needed, explain any answers in Remarks.)

SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present? Yes <input checked="" type="checkbox"/> No _____ Hydric Soil Present? Yes _____ No <input checked="" type="checkbox"/> Wetland Hydrology Present? Yes <input checked="" type="checkbox"/> No _____	Is the Sampled Area within a Wetland? Yes _____ No <input checked="" type="checkbox"/>
Remarks: Wetter than normal conditions were present. Two of the three necessary wetland indicators are present. The WDP is not located within a wetland.	

VEGETATION – Use scientific names of plants.

Tree Stratum (Plot size: <u>30'</u>)	Absolute % Cover	Dominant Species?	Indicator Status	
1. <u>Ulmus crassifolia</u>	40	Y	FAC	Dominance Test worksheet: Number of Dominant Species That Are OBL, FACW, or FAC (excluding FAC-): <u>3</u> (A) Total Number of Dominant Species Across All Strata: <u>3</u> (B) Percent of Dominant Species That Are OBL, FACW, or FAC: <u>100</u> (A/B)
2. <u>Fraxinus pennsylvanica</u>	30	Y	FAC	
3. <u>Celtis laevigata</u>	10	N	FACU	
4. <u>Vachellia farnesiana</u>	5	N	FACU	
<u>85</u> = Total Cover				Prevalence Index worksheet: Total % Cover of: _____ Multiply by: _____ OBL species _____ x 1 = _____ FACW species _____ x 2 = _____ FAC species _____ x 3 = _____ FACU species _____ x 4 = _____ UPL species _____ x 5 = _____ Column Totals: _____ (A) _____ (B) Prevalence Index = B/A = _____
<u>0</u> = Total Cover				
Sapling/Shrub Stratum (Plot size: <u>15'</u>) 1. <u>None</u> 2. _____ 3. _____ 4. _____ 5. _____				
Herb Stratum (Plot size: <u>5'</u>) 1. <u>Calyptocarpus vialis</u> 2. <u>Elymus canadensis</u> 3. _____ 4. _____ 5. _____ 6. _____ 7. _____ 8. _____ 9. _____ 10. _____				
<u>85</u> = Total Cover				
Woody Vine Stratum (Plot size: <u>30'</u>) 1. <u>None</u> 2. _____ % Bare Ground in Herb Stratum <u>0</u> _____ = Total Cover				Hydrophytic Vegetation Indicators: ___ 1 - Rapid Test for Hydrophytic Vegetation <input checked="" type="checkbox"/> 2 - Dominance Test is >50% ___ 3 - Prevalence Index is ≤3.0 ¹ ___ 4 - Morphological Adaptations ¹ (Provide supporting data in Remarks or on a separate sheet) ___ Problematic Hydrophytic Vegetation ¹ (Explain) ¹ Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.
Hydrophytic Vegetation Present? Yes <input checked="" type="checkbox"/> No _____				
Remarks: The vegetation dominance test passed.				

SOIL

Sampling Point: WDPI_AB_7.31

Profile Description: (Describe to the depth needed to document the indicator or confirm the absence of indicators.)

Depth (inches)	Matrix		Redox Features				Texture	Remarks
	Color (moist)	%	Color (moist)	%	Type ¹	Loc ²		
0-2	10 YR 3/1	100	None				Clay	
2-14	10 YR 3/3	100	None				Clay	

¹Type: C=Concentration, D=Depletion, RM=Reduced Matrix, CS=Covered or Coated Sand Grains. ²Location: PL=Pore Lining, M=Matrix.

Hydric Soil Indicators: (Applicable to all LRRs, unless otherwise noted.)

- Histosol (A1)
- Histic Epipedon (A2)
- Black Histic (A3)
- Hydrogen Sulfide (A4)
- Stratified Layers (A5) **(LRR F)**
- 1 cm Muck (A9) **(LRR F, G, H)**
- Depleted Below Dark Surface (A11)
- Thick Dark Surface (A12)
- Sandy Mucky Mineral (S1)
- 2.5 cm Mucky Peat or Peat (S2) **(LRR G, H)**
- 5 cm Mucky Peat or Peat (S3) **(LRR F)**
- Sandy Gleyed Matrix (S4)
- Sandy Redox (S5)
- Stripped Matrix (S6)
- Loamy Mucky Mineral (F1)
- Loamy Gleyed Matrix (F2)
- Depleted Matrix (F3)
- Redox Dark Surface (F6)
- Depleted Dark Surface (F7)
- Redox Depressions (F8)
- High Plains Depressions (F16) **(MLRA 72 & 73 of LRR H)**

Indicators for Problematic Hydric Soils³:

- 1 cm Muck (A9) **(LRR I, J)**
 - Coast Prairie Redox (A16) **(LRR F, G, H)**
 - Dark Surface (S7) **(LRR G)**
 - High Plains Depressions (F16) **(LRR H outside of MLRA 72 & 73)**
 - Reduced Vertic (F18)
 - Red Parent Material (TF2)
 - Very Shallow Dark Surface (TF12)
 - Other (Explain in Remarks)
- ³Indicators of hydrophytic vegetation and wetland hydrology must be present, unless disturbed or problematic.

Restrictive Layer (if present):

Type: None
 Depth (inches): N/A

Hydric Soil Present? Yes No

Remarks:

Hydric soil indicators are not present.

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (minimum of one required; check all that apply)

- Surface Water (A1)
- High Water Table (A2)
- Saturation (A3)
- Water Marks (B1)
- Sediment Deposits (B2)
- Drift Deposits (B3)
- Algal Mat or Crust (B4)
- Iron Deposits (B5)
- Inundation Visible on Aerial Imagery (B7)
- Water-Stained Leaves (B9)
- Salt Crust (B11)
- Aquatic Invertebrates (B13)
- Hydrogen Sulfide Odor (C1)
- Dry-Season Water Table (C2)
- Oxidized Rhizospheres on Living Roots (C3) **(where not tilled)**
- Presence of Reduced Iron (C4)
- Thin Muck Surface (C7)
- Other (Explain in Remarks)

Secondary Indicators (minimum of two required)

- Surface Soil Cracks (B6)
- Sparsely Vegetated Concave Surface (B8)
- Drainage Patterns (B10)
- Oxidized Rhizospheres on Living Roots (C3) **(where tilled)**
- Crayfish Burrows (C8)
- Saturation Visible on Aerial Imagery (C9)
- Geomorphic Position (D2)
- FAC-Neutral Test (D5)
- Frost-Heave Hummocks (D7) **(LRR F)**

Field Observations:

Surface Water Present? Yes No Depth (inches): _____
 Water Table Present? Yes No Depth (inches): _____
 Saturation Present? (includes capillary fringe) Yes No Depth (inches): _____

Wetland Hydrology Present? Yes No

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Remarks:

Hydrology indicators drift deposits (B3), drainage patterns (B10), and geomorphic position (D2) are present. Wetland hydrology is present.

WETLAND DETERMINATION DATA FORM – Great Plains Region

Project/Site: Loop 1604 from SH 16 to I-35 City/County: Bexar County Sampling Date: 08.06.2019
 Applicant/Owner: TxDOT State: TX Sampling Point: WDP1_AB_8.6
 Investigator(s): Austin Blase, Claire Para Section, Township, Range: N/A
 Landform (hillslope, terrace, etc.): Terrace Local relief (concave, convex, none): None Slope (%): 0-1
 Subregion (LRR): LRR I Lat: 29.60922246 Long: -98.51525205 Datum: NAD 83
 Soil Map Unit Name: TaB - Eckrant cobbly clay, 1 to 8 percent slopes NWI classification: R4SBA

Are climatic / hydrologic conditions on the site typical for this time of year? Yes No (If no, explain in Remarks.)
 Are Vegetation , Soil , or Hydrology significantly disturbed? Are "Normal Circumstances" present? Yes No
 Are Vegetation , Soil , or Hydrology naturally problematic? (If needed, explain any answers in Remarks.)

SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present? Yes <input type="checkbox"/> No <input checked="" type="checkbox"/> Hydric Soil Present? Yes <input type="checkbox"/> No <input checked="" type="checkbox"/> Wetland Hydrology Present? Yes <input checked="" type="checkbox"/> No <input type="checkbox"/>	Is the Sampled Area within a Wetland? Yes <input type="checkbox"/> No <input checked="" type="checkbox"/>
Remarks: One of the three necessary wetland indicators is present. The WDP is not located within a wetland.	

VEGETATION – Use scientific names of plants.

Tree Stratum (Plot size: <u>30'</u>)	Absolute % Cover	Dominant Species?	Indicator Status

1. <u>None</u>				Hydrophytic Vegetation Present? Yes <input type="checkbox"/> No <input checked="" type="checkbox"/>
2. _____				
	<u>0</u>	= Total Cover		

Remarks:
 The vegetative community did not pass the dominance test.

SOIL

Sampling Point: WDPI_AB_8.6

Profile Description: (Describe to the depth needed to document the indicator or confirm the absence of indicators.)

Depth (inches)	Matrix		Redox Features				Texture	Remarks
	Color (moist)	%	Color (moist)	%	Type ¹	Loc ²		
0-11	10 YR 3/2	100	None				Loam	

¹Type: C=Concentration, D=Depletion, RM=Reduced Matrix, CS=Covered or Coated Sand Grains. ²Location: PL=Pore Lining, M=Matrix.

Hydric Soil Indicators: (Applicable to all LRRs, unless otherwise noted.)

- Histosol (A1)
- Histic Epipedon (A2)
- Black Histic (A3)
- Hydrogen Sulfide (A4)
- Stratified Layers (A5) (LRR F)
- 1 cm Muck (A9) (LRR F, G, H)
- Depleted Below Dark Surface (A11)
- Thick Dark Surface (A12)
- Sandy Mucky Mineral (S1)
- 2.5 cm Mucky Peat or Peat (S2) (LRR G, H)
- 5 cm Mucky Peat or Peat (S3) (LRR F)
- Sandy Gleyed Matrix (S4)
- Sandy Redox (S5)
- Stripped Matrix (S6)
- Loamy Mucky Mineral (F1)
- Loamy Gleyed Matrix (F2)
- Depleted Matrix (F3)
- Redox Dark Surface (F6)
- Depleted Dark Surface (F7)
- Redox Depressions (F8)
- High Plains Depressions (F16) (MLRA 72 & 73 of LRR H)

Indicators for Problematic Hydric Soils³:

- 1 cm Muck (A9) (LRR I, J)
 - Coast Prairie Redox (A16) (LRR F, G, H)
 - Dark Surface (S7) (LRR G)
 - High Plains Depressions (F16) (LRR H outside of MLRA 72 & 73)
 - Reduced Vertic (F18)
 - Red Parent Material (TF2)
 - Very Shallow Dark Surface (TF12)
 - Other (Explain in Remarks)
- ³Indicators of hydrophytic vegetation and wetland hydrology must be present, unless disturbed or problematic.

Restrictive Layer (if present):

Type: Limestone
 Depth (inches): 11"

Hydric Soil Present? Yes No

Remarks:

Hydric soil indicators are not present.

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (minimum of one required; check all that apply)

- Surface Water (A1)
- High Water Table (A2)
- Saturation (A3)
- Water Marks (B1)
- Sediment Deposits (B2)
- Drift Deposits (B3)
- Algal Mat or Crust (B4)
- Iron Deposits (B5)
- Inundation Visible on Aerial Imagery (B7)
- Water-Stained Leaves (B9)
- Salt Crust (B11)
- Aquatic Invertebrates (B13)
- Hydrogen Sulfide Odor (C1)
- Dry-Season Water Table (C2)
- Oxidized Rhizospheres on Living Roots (C3) (where not tilled)
- Presence of Reduced Iron (C4)
- Thin Muck Surface (C7)
- Other (Explain in Remarks)

Secondary Indicators (minimum of two required)

- Surface Soil Cracks (B6)
- Sparsely Vegetated Concave Surface (B8)
- Drainage Patterns (B10)
- Oxidized Rhizospheres on Living Roots (C3) (where tilled)
- Crayfish Burrows (C8)
- Saturation Visible on Aerial Imagery (C9)
- Geomorphic Position (D2)
- FAC-Neutral Test (D5)
- Frost-Heave Hummocks (D7) (LRR F)

Field Observations:

Surface Water Present? Yes No Depth (inches): _____
 Water Table Present? Yes No Depth (inches): _____
 Saturation Present? (includes capillary fringe) Yes No Depth (inches): _____

Wetland Hydrology Present? Yes No

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Remarks:

One primary indicator drift deposits (B3) is present.

¹Type: C=Concentration, D=Depletion, RM=Reduced Matrix, CS=Covered or Coated Sand Grains. ²Location: PL=Pore Lining, M=Matrix.

Hydric Soil Indicators: (Applicable to all LRRs, unless otherwise noted.)

- Histosol (A1)
- Histic Epipedon (A2)
- Black Histic (A3)
- Hydrogen Sulfide (A4)
- Stratified Layers (A5) (LRR F)
- 1 cm Muck (A9) (LRR F, G, H)
- Depleted Below Dark Surface (A11)
- Thick Dark Surface (A12)
- Sandy Mucky Mineral (S1)
- 2.5 cm Mucky Peat or Peat (S2) (LRR G, H)
- 5 cm Mucky Peat or Peat (S3) (LRR F)
- Sandy Gleyed Matrix (S4)
- Sandy Redox (S5)
- Stripped Matrix (S6)
- Loamy Mucky Mineral (F1)
- Loamy Gleyed Matrix (F2)
- Depleted Matrix (F3)
- Redox Dark Surface (F6)
- Depleted Dark Surface (F7)
- Redox Depressions (F8)
- High Plains Depressions (F16) (MLRA 72 & 73 of LRR H)

Indicators for Problematic Hydric Soils³:

- 1 cm Muck (A9) (LRR I, J)
- Coast Prairie Redox (A16) (LRR F, G, H)
- Dark Surface (S7) (LRR G)
- High Plains Depressions (F16) (LRR H outside of MLRA 72 & 73)
- Reduced Vertic (F18)
- Red Parent Material (TF2)
- Very Shallow Dark Surface (TF12)
- Other (Explain in Remarks)

³Indicators of hydrophytic vegetation and wetland hydrology must be present, unless disturbed or problematic.

Restrictive Layer (if present):

Type: None
 Depth (inches): N/A

Hydric Soil Present? Yes No

Remarks:

Hydric soil indicators are not present.

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (minimum of one required; check all that apply)

- Surface Water (A1)
- High Water Table (A2)
- Saturation (A3)
- Water Marks (B1)
- Sediment Deposits (B2)
- Drift Deposits (B3)
- Algal Mat or Crust (B4)
- Iron Deposits (B5)
- Inundation Visible on Aerial Imagery (B7)
- Water-Stained Leaves (B9)
- Salt Crust (B11)
- Aquatic Invertebrates (B13)
- Hydrogen Sulfide Odor (C1)
- Dry-Season Water Table (C2)
- Oxidized Rhizospheres on Living Roots (C3) (where not tilled)
- Presence of Reduced Iron (C4)
- Thin Muck Surface (C7)
- Other (Explain in Remarks)

Secondary Indicators (minimum of two required)

- Surface Soil Cracks (B6)
- Sparsely Vegetated Concave Surface (B8)
- Drainage Patterns (B10)
- Oxidized Rhizospheres on Living Roots (C3) (where tilled)
- Crayfish Burrows (C8)
- Saturation Visible on Aerial Imagery (C9)
- Geomorphic Position (D2)
- FAC-Neutral Test (D5)
- Frost-Heave Hummocks (D7) (LRR F)

Field Observations:

Surface Water Present? Yes No Depth (inches): _____
 Water Table Present? Yes No Depth (inches): _____
 Saturation Present? (includes capillary fringe) Yes No Depth (inches): _____

Wetland Hydrology Present? Yes No

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Remarks:

Two primary indicators sediment deposits (B2), drift deposits (B3), and two secondary indicators drainage patterns (B10), and geomorphic position (D2) are present.

WETLAND DETERMINATION DATA FORM – Great Plains Region

Project/Site: Loop 1604 from SH 16 to I-35 City/County: Bexar County Sampling Date: 08.06.2019
 Applicant/Owner: TxDOT State: TX Sampling Point: WDP2_AB_8.6
 Investigator(s): Austin Blase, Claire Parra Section, Township, Range: N/A
 Landform (hillslope, terrace, etc.): Terrace Local relief (concave, convex, none): None Slope (%): 0-1
 Subregion (LRR): LRR I Lat: 29.60785299 Long: -98.5165964 Datum: NAD 83
 Soil Map Unit Name: TaB - Eckrant cobbly clay, 1 to 8 percent slopes NWI classification: R4SBA

Are climatic / hydrologic conditions on the site typical for this time of year? Yes No (If no, explain in Remarks.)
 Are Vegetation , Soil , or Hydrology significantly disturbed? Are "Normal Circumstances" present? Yes No
 Are Vegetation , Soil , or Hydrology naturally problematic? (If needed, explain any answers in Remarks.)

SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present? Yes <input checked="" type="checkbox"/> No <input type="checkbox"/> Hydric Soil Present? Yes <input type="checkbox"/> No <input checked="" type="checkbox"/> Wetland Hydrology Present? Yes <input checked="" type="checkbox"/> No <input type="checkbox"/>	Is the Sampled Area within a Wetland? Yes <input type="checkbox"/> No <input checked="" type="checkbox"/>
Remarks: Two of the three wetland indicators are present. The point is not located in a wetland.	

VEGETATION – Use scientific names of plants.

Tree Stratum (Plot size: <u>30'</u>)	Absolute % Cover	Dominant Species?	Indicator Status	
1. <u>None</u>				Dominance Test worksheet: Number of Dominant Species That Are OBL, FACW, or FAC (excluding FAC-): <u>2</u> (A) Total Number of Dominant Species Across All Strata: <u>3</u> (B) Percent of Dominant Species That Are OBL, FACW, or FAC: <u>66.7</u> (A/B)

SOIL

Sampling Point: WDP3_WM_7.10

Profile Description: (Describe to the depth needed to document the indicator or confirm the absence of indicators.)

Depth (inches)	Matrix		Redox Features				Texture	Remarks
	Color (moist)	%	Color (moist)	%	Type ¹	Loc ²		
0-4	10YR 3/1	100	None				Clay loam	
4-8	10Y 3/3	100	None				Clay	with sand & gravel

¹Type: C=Concentration, D=Depletion, RM=Reduced Matrix, CS=Covered or Coated Sand Grains. ²Location: PL=Pore Lining, M=Matrix.

Hydric Soil Indicators: (Applicable to all LRRs, unless otherwise noted.)

- Histosol (A1)
- Histic Epipedon (A2)
- Black Histic (A3)
- Hydrogen Sulfide (A4)
- Stratified Layers (A5) (LRR F)
- 1 cm Muck (A9) (LRR F, G, H)
- Depleted Below Dark Surface (A11)
- Thick Dark Surface (A12)
- Sandy Mucky Mineral (S1)
- 2.5 cm Mucky Peat or Peat (S2) (LRR G, H)
- 5 cm Mucky Peat or Peat (S3) (LRR F)
- Sandy Gleyed Matrix (S4)
- Sandy Redox (S5)
- Stripped Matrix (S6)
- Loamy Mucky Mineral (F1)
- Loamy Gleyed Matrix (F2)
- Depleted Matrix (F3)
- Redox Dark Surface (F6)
- Depleted Dark Surface (F7)
- Redox Depressions (F8)
- High Plains Depressions (F16) (MLRA 72 & 73 of LRR H)

Indicators for Problematic Hydric Soils³:

- 1 cm Muck (A9) (LRR I, J)
 - Coast Prairie Redox (A16) (LRR F, G, H)
 - Dark Surface (S7) (LRR G)
 - High Plains Depressions (F16) (LRR H outside of MLRA 72 & 73)
 - Reduced Vertic (F18)
 - Red Parent Material (TF2)
 - Very Shallow Dark Surface (TF12)
 - Other (Explain in Remarks)
- ³Indicators of hydrophytic vegetation and wetland hydrology must be present, unless disturbed or problematic.

Restrictive Layer (if present):

Type: Rock-Limestone
 Depth (inches): 8

Hydric Soil Present? Yes No

Remarks:

Hydric soil indicators are not present.

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (minimum of one required; check all that apply)

- Surface Water (A1)
- High Water Table (A2)
- Saturation (A3)
- Water Marks (B1)
- Sediment Deposits (B2)
- Drift Deposits (B3)
- Algal Mat or Crust (B4)
- Iron Deposits (B5)
- Inundation Visible on Aerial Imagery (B7)
- Water-Stained Leaves (B9)
- Salt Crust (B11)
- Aquatic Invertebrates (B13)
- Hydrogen Sulfide Odor (C1)
- Dry-Season Water Table (C2)
- Oxidized Rhizospheres on Living Roots (C3) (where not tilled)
- Presence of Reduced Iron (C4)
- Thin Muck Surface (C7)
- Other (Explain in Remarks)

Secondary Indicators (minimum of two required)

- Surface Soil Cracks (B6)
- Sparsely Vegetated Concave Surface (B8)
- Drainage Patterns (B10)
- Oxidized Rhizospheres on Living Roots (C3) (where tilled)
- Crayfish Burrows (C8)
- Saturation Visible on Aerial Imagery (C9)
- Geomorphic Position (D2)
- FAC-Neutral Test (D5)
- Frost-Heave Hummocks (D7) (LRR F)

Field Observations:

Surface Water Present? Yes No Depth (inches): _____
 Water Table Present? Yes No Depth (inches): _____
 Saturation Present? (includes capillary fringe) Yes No Depth (inches): _____

Wetland Hydrology Present? Yes No

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Remarks:

One secondary indicator geomorphic position (D2) is present.

0-8	10 YR 2/1	100	None				Silty Loam	

¹Type: C=Concentration, D=Depletion, RM=Reduced Matrix, CS=Covered or Coated Sand Grains. ²Location: PL=Pore Lining, M=Matrix.

Hydric Soil Indicators: (Applicable to all LRRs, unless otherwise noted.)

- Histosol (A1)
- Histic Epipedon (A2)
- Black Histic (A3)
- Hydrogen Sulfide (A4)
- Stratified Layers (A5) (LRR F)
- 1 cm Muck (A9) (LRR F, G, H)
- Depleted Below Dark Surface (A11)
- Thick Dark Surface (A12)
- Sandy Mucky Mineral (S1)
- 2.5 cm Mucky Peat or Peat (S2) (LRR G, H)
- 5 cm Mucky Peat or Peat (S3) (LRR F)
- Sandy Gleyed Matrix (S4)
- Sandy Redox (S5)
- Stripped Matrix (S6)
- Loamy Mucky Mineral (F1)
- Loamy Gleyed Matrix (F2)
- Depleted Matrix (F3)
- Redox Dark Surface (F6)
- Depleted Dark Surface (F7)
- Redox Depressions (F8)
- High Plains Depressions (F16) (MLRA 72 & 73 of LRR H)

Indicators for Problematic Hydric Soils³:

- 1 cm Muck (A9) (LRR I, J)
 - Coast Prairie Redox (A16) (LRR F, G, H)
 - Dark Surface (S7) (LRR G)
 - High Plains Depressions (F16) (LRR H outside of MLRA 72 & 73)
 - Reduced Vertic (F18)
 - Red Parent Material (TF2)
 - Very Shallow Dark Surface (TF12)
 - Other (Explain in Remarks)
- ³Indicators of hydrophytic vegetation and wetland hydrology must be present, unless disturbed or problematic.

Restrictive Layer (if present):

Type: None
 Depth (inches): N/A

Hydric Soil Present? Yes No

Remarks:

Hydric soil indicators are not present.

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (minimum of one required; check all that apply)

- Surface Water (A1)
- High Water Table (A2)
- Saturation (A3)
- Water Marks (B1)
- Sediment Deposits (B2)
- Drift Deposits (B3)
- Algal Mat or Crust (B4)
- Iron Deposits (B5)
- Inundation Visible on Aerial Imagery (B7)
- Water-Stained Leaves (B9)
- Salt Crust (B11)
- Aquatic Invertebrates (B13)
- Hydrogen Sulfide Odor (C1)
- Dry-Season Water Table (C2)
- Oxidized Rhizospheres on Living Roots (C3) (where not tilled)
- Presence of Reduced Iron (C4)
- Thin Muck Surface (C7)
- Other (Explain in Remarks)

Secondary Indicators (minimum of two required)

- Surface Soil Cracks (B6)
- Sparsely Vegetated Concave Surface (B8)
- Drainage Patterns (B10)
- Oxidized Rhizospheres on Living Roots (C3) (where tilled)
- Crayfish Burrows (C8)
- Saturation Visible on Aerial Imagery (C9)
- Geomorphic Position (D2)
- FAC-Neutral Test (D5)
- Frost-Heave Hummocks (D7) (LRR F)

Field Observations:

Surface Water Present? Yes No Depth (inches): _____
 Water Table Present? Yes No Depth (inches): _____
 Saturation Present? (includes capillary fringe) Yes No Depth (inches): _____

Wetland Hydrology Present? Yes No

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Remarks:

Two primary indicators sediment deposits (B2), drift deposits (B3), and three secondary indicators surface soil cracks (B6), drainage patterns (B10), and geomorphic position (D2) are present.

0-4	10 YR 2/1	100	None				Clay Loam	
4-9	10 YR 4/3	100	None				Clay Loam	
9-12	10 YR 2/2	100	None				Clay	

¹Type: C=Concentration, D=Depletion, RM=Reduced Matrix, CS=Covered or Coated Sand Grains. ²Location: PL=Pore Lining, M=Matrix.

Hydric Soil Indicators: (Applicable to all LRRs, unless otherwise noted.)

- Histosol (A1)
- Histic Epipedon (A2)
- Black Histic (A3)
- Hydrogen Sulfide (A4)
- Stratified Layers (A5) (LRR F)
- 1 cm Muck (A9) (LRR F, G, H)
- Depleted Below Dark Surface (A11)
- Thick Dark Surface (A12)
- Sandy Mucky Mineral (S1)
- 2.5 cm Mucky Peat or Peat (S2) (LRR G, H)
- 5 cm Mucky Peat or Peat (S3) (LRR F)
- Sandy Gleyed Matrix (S4)
- Sandy Redox (S5)
- Stripped Matrix (S6)
- Loamy Mucky Mineral (F1)
- Loamy Gleyed Matrix (F2)
- Depleted Matrix (F3)
- Redox Dark Surface (F6)
- Depleted Dark Surface (F7)
- Redox Depressions (F8)
- High Plains Depressions (F16) (MLRA 72 & 73 of LRR H)

Indicators for Problematic Hydric Soils³:

- 1 cm Muck (A9) (LRR I, J)
 - Coast Prairie Redox (A16) (LRR F, G, H)
 - Dark Surface (S7) (LRR G)
 - High Plains Depressions (F16) (LRR H outside of MLRA 72 & 73)
 - Reduced Vertic (F18)
 - Red Parent Material (TF2)
 - Very Shallow Dark Surface (TF12)
 - Other (Explain in Remarks)
- ³Indicators of hydrophytic vegetation and wetland hydrology must be present, unless disturbed or problematic.

Restrictive Layer (if present):

Type: None
 Depth (inches): N/A

Hydric Soil Present? Yes No

Remarks:

Hydric soil indicators are not present. Small gravel was present throughout the soil sample.

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (minimum of one required; check all that apply)

- Surface Water (A1)
- High Water Table (A2)
- Saturation (A3)
- Water Marks (B1)
- Sediment Deposits (B2)
- Drift Deposits (B3)
- Algal Mat or Crust (B4)
- Iron Deposits (B5)
- Inundation Visible on Aerial Imagery (B7)
- Water-Stained Leaves (B9)
- Salt Crust (B11)
- Aquatic Invertebrates (B13)
- Hydrogen Sulfide Odor (C1)
- Dry-Season Water Table (C2)
- Oxidized Rhizospheres on Living Roots (C3) (where not tilled)
- Presence of Reduced Iron (C4)
- Thin Muck Surface (C7)
- Other (Explain in Remarks)

Secondary Indicators (minimum of two required)

- Surface Soil Cracks (B6)
- Sparsely Vegetated Concave Surface (B8)
- Drainage Patterns (B10)
- Oxidized Rhizospheres on Living Roots (C3) (where tilled)
- Crayfish Burrows (C8)
- Saturation Visible on Aerial Imagery (C9)
- Geomorphic Position (D2)
- FAC-Neutral Test (D5)
- Frost-Heave Hummocks (D7) (LRR F)

Field Observations:

Surface Water Present? Yes No Depth (inches): _____
 Water Table Present? Yes No Depth (inches): _____
 Saturation Present? (includes capillary fringe) Yes No Depth (inches): _____

Wetland Hydrology Present? Yes No

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Remarks:

One primary indicator drift deposits (B3), and two secondary indicators drainage patterns (B10), and geomorphic position (D2) are present.

WETLAND DETERMINATION DATA FORM – Great Plains Region

Project/Site: Loop 1604 from SH 16 to I-35 City/County: Bexar County Sampling Date: 05.15.2019
 Applicant/Owner: TxDOT State: TX Sampling Point: WDP4_WM_5.15
 Investigator(s): Walt Meitzen Section, Township, Range: N/A
 Landform (hillslope, terrace, etc.): Terrace Local relief (concave, convex, none): None Slope (%): 0-1
 Subregion (LRR): LRR I Lat: 29.56136733 Long: -98.65756528 Datum: NAD 83
 Soil Map Unit Name: Cb - Crawford and Bexar stony soils NWI classification: R4SBC

Are climatic / hydrologic conditions on the site typical for this time of year? Yes No (If no, explain in Remarks.)
 Are Vegetation , Soil , or Hydrology significantly disturbed? Are "Normal Circumstances" present? Yes No
 Are Vegetation , Soil , or Hydrology naturally problematic? (If needed, explain any answers in Remarks.)

SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present? Yes <input checked="" type="checkbox"/> No <input type="checkbox"/> Hydric Soil Present? Yes <input type="checkbox"/> No <input checked="" type="checkbox"/> Wetland Hydrology Present? Yes <input checked="" type="checkbox"/> No <input type="checkbox"/>	Is the Sampled Area within a Wetland? Yes <input type="checkbox"/> No <input checked="" type="checkbox"/>
Remarks: Two of the three necessary wetland indicators are present. The WDP is not located within a wetland.	

VEGETATION – Use scientific names of plants.

Hydric Soil Indicators: (Applicable to all LRRs, unless otherwise noted.)

- Histosol (A1)
- Histic Epipedon (A2)
- Black Histic (A3)
- Hydrogen Sulfide (A4)
- Stratified Layers (A5) **(LRR F)**
- 1 cm Muck (A9) **(LRR F, G, H)**
- Depleted Below Dark Surface (A11)
- Thick Dark Surface (A12)
- Sandy Mucky Mineral (S1)
- 2.5 cm Mucky Peat or Peat (S2) **(LRR G, H)**
- 5 cm Mucky Peat or Peat (S3) **(LRR F)**
- Sandy Gleyed Matrix (S4)
- Sandy Redox (S5)
- Stripped Matrix (S6)
- Loamy Mucky Mineral (F1)
- Loamy Gleyed Matrix (F2)
- Depleted Matrix (F3)
- Redox Dark Surface (F6)
- Depleted Dark Surface (F7)
- Redox Depressions (F8)
- High Plains Depressions (F16) **(MLRA 72 & 73 of LRR H)**

Indicators for Problematic Hydric Soils³:

- 1 cm Muck (A9) **(LRR I, J)**
- Coast Prairie Redox (A16) **(LRR F, G, H)**
- Dark Surface (S7) **(LRR G)**
- High Plains Depressions (F16) **(LRR H outside of MLRA 72 & 73)**
- Reduced Vertic (F18)
- Red Parent Material (TF2)
- Very Shallow Dark Surface (TF12)
- Other (Explain in Remarks)

³Indicators of hydrophytic vegetation and wetland hydrology must be present, unless disturbed or problematic.

Restrictive Layer (if present):

Type: Limestone cobble
 Depth (inches): 10"

Hydric Soil Present? Yes No

Remarks:

Hydric soil indicators are not present.

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (minimum of one required; check all that apply)

- Surface Water (A1)
- High Water Table (A2)
- Saturation (A3)
- Water Marks (B1)
- Sediment Deposits (B2)
- Drift Deposits (B3)
- Algal Mat or Crust (B4)
- Iron Deposits (B5)
- Inundation Visible on Aerial Imagery (B7)
- Water-Stained Leaves (B9)
- Salt Crust (B11)
- Aquatic Invertebrates (B13)
- Hydrogen Sulfide Odor (C1)
- Dry-Season Water Table (C2)
- Oxidized Rhizospheres on Living Roots (C3) **(where not tilled)**
- Presence of Reduced Iron (C4)
- Thin Muck Surface (C7)
- Other (Explain in Remarks)

Secondary Indicators (minimum of two required)

- Surface Soil Cracks (B6)
- Sparsely Vegetated Concave Surface (B8)
- Drainage Patterns (B10)
- Oxidized Rhizospheres on Living Roots (C3) **(where tilled)**
- Crayfish Burrows (C8)
- Saturation Visible on Aerial Imagery (C9)
- Geomorphic Position (D2)
- FAC-Neutral Test (D5)
- Frost-Heave Hummocks (D7) **(LRR F)**

Field Observations:

Surface Water Present? Yes No Depth (inches): _____
 Water Table Present? Yes No Depth (inches): _____
 Saturation Present? (includes capillary fringe) Yes No Depth (inches): _____

Wetland Hydrology Present? Yes No

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Remarks:

One secondary indicator geomorphic position (D2) is present.

WETLAND DETERMINATION DATA FORM – Great Plains Region

Project/Site: Loop 1604 from SH 16 to I-35 City/County: Bexar County Sampling Date: 05.15.2019
 Applicant/Owner: TxDOT State: TX Sampling Point: WDP5_WM_5.15
 Investigator(s): Walt Meitzen Section, Township, Range: N/A
 Landform (hillslope, terrace, etc.): Terrace Local relief (concave, convex, none): None Slope (%): 0-1
 Subregion (LRR): LRR I Lat: 29.56125291 Long: -98.65763074 Datum: NAD 83

- Loamy Mucky Mineral (F1)
- Loamy Gleyed Matrix (F2)
- Depleted Matrix (F3)
- Redox Dark Surface (F6)
- Depleted Dark Surface (F7)
- Redox Depressions (F8)
- High Plains Depressions (F16) (MLRA 72 & 73 of LRR H)

Indicators for Problematic Hydric Soils³:

- 1 cm Muck (A9) (LRR I, J)
- Coast Prairie Redox (A16) (LRR F, G, H)
- Dark Surface (S7) (LRR G)
- High Plains Depressions (F16) (LRR H outside of MLRA 72 & 73)
- Reduced Vertic (F18)
- Red Parent Material (TF2)
- Very Shallow Dark Surface (TF12)
- Other (Explain in Remarks)

³Indicators of hydrophytic vegetation and wetland hydrology must be present, unless disturbed or problematic.

Restrictive Layer (if present):

Type: None
 Depth (inches): N/A

Hydric Soil Present? Yes No

Remarks:

Hydric soil indicators are not present.

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (minimum of one required; check all that apply)

- Surface Water (A1)
- High Water Table (A2)
- Saturation (A3)
- Water Marks (B1)
- Sediment Deposits (B2)
- Drift Deposits (B3)
- Algal Mat or Crust (B4)
- Iron Deposits (B5)
- Inundation Visible on Aerial Imagery (B7)
- Water-Stained Leaves (B9)
- Salt Crust (B11)
- Aquatic Invertebrates (B13)
- Hydrogen Sulfide Odor (C1)
- Dry-Season Water Table (C2)
- Oxidized Rhizospheres on Living Roots (C3) (where not tilled)
- Presence of Reduced Iron (C4)
- Thin Muck Surface (C7)
- Other (Explain in Remarks)

Secondary Indicators (minimum of two required)

- Surface Soil Cracks (B6)
- Sparsely Vegetated Concave Surface (B8)
- Drainage Patterns (B10)
- Oxidized Rhizospheres on Living Roots (C3) (where tilled)
- Crayfish Burrows (C8)
- Saturation Visible on Aerial Imagery (C9)
- Geomorphic Position (D2)
- FAC-Neutral Test (D5)
- Frost-Heave Hummocks (D7) (LRR F)

Field Observations:

Surface Water Present? Yes No Depth (inches): _____
 Water Table Present? Yes No Depth (inches): _____
 Saturation Present? (includes capillary fringe) Yes No Depth (inches): _____

Wetland Hydrology Present? Yes No

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Remarks:

Two primary indicators sediment deposits (B2) and drift deposits (B3), and one secondary geomorphic position (D2) are present.

WETLAND DETERMINATION DATA FORM – Great Plains Region

Project/Site: Loop 1604 from SH 16 to I-35 City/County: Bexar County Sampling Date: 07.08.2019
 Applicant/Owner: TxDOT State: TX Sampling Point: WDP6_CMP_8.7
 Investigator(s): Walt Meitzen Section, Township, Range: N/A
 Landform (hillslope, terrace, etc.): Terrace Local relief (concave, convex, none): None Slope (%): 0-1
 Subregion (LRR): LRR I Lat: 29.58604814 Long: -98.6333189 Datum: NAD 83
 Soil Map Unit Name: Cb - Crawford and Bexar stony soils NWI classification: None

Are climatic / hydrologic conditions on the site typical for this time of year? Yes No (If no, explain in Remarks.)
 Are Vegetation , Soil , or Hydrology significantly disturbed? Are "Normal Circumstances" present? Yes No
 Are Vegetation , Soil , or Hydrology naturally problematic? (If needed, explain any answers in Remarks.)

SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present? Yes <input checked="" type="checkbox"/> No <input type="checkbox"/> Hydric Soil Present? Yes <input type="checkbox"/> No <input checked="" type="checkbox"/> Wetland Hydrology Present? Yes <input checked="" type="checkbox"/> No <input type="checkbox"/>	Is the Sampled Area within a Wetland? Yes <input type="checkbox"/> No <input checked="" type="checkbox"/>
Remarks: Two of the three necessary wetland indicators are present. The WDP is not located within a wetland.	

VEGETATION – Use scientific names of plants.

- Black Histic (A3)
- Hydrogen Sulfide (A4)
- Stratified Layers (A5) (LRR F)
- 1 cm Muck (A9) (LRR F, G, H)
- Depleted Below Dark Surface (A11)
- Thick Dark Surface (A12)
- Sandy Mucky Mineral (S1)
- 2.5 cm Mucky Peat or Peat (S2) (LRR G, H)
- 5 cm Mucky Peat or Peat (S3) (LRR F)
- Sandy Gleyed Matrix (S4)
- Sandy Redox (S5)
- Stripped Matrix (S6)
- Loamy Mucky Mineral (F1)
- Loamy Gleyed Matrix (F2)
- Depleted Matrix (F3)
- Redox Dark Surface (F6)
- Depleted Dark Surface (F7)
- Redox Depressions (F8)
- High Plains Depressions (F16) (MLRA 72 & 73 of LRR H)

Indicators for Problematic Hydric Soils³:

- 1 cm Muck (A9) (LRR I, J)
- Coast Prairie Redox (A16) (LRR F, G, H)
- Dark Surface (S7) (LRR G)
- High Plains Depressions (F16) (LRR H outside of MLRA 72 & 73)
- Reduced Vertic (F18)
- Red Parent Material (TF2)
- Very Shallow Dark Surface (TF12)
- Other (Explain in Remarks)

³Indicators of hydrophytic vegetation and wetland hydrology must be present, unless disturbed or problematic.

Restrictive Layer (if present):

Type: None
 Depth (inches): N/A

Hydric Soil Present? Yes No

Remarks:

Hydric soil indicators are not present.

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (minimum of one required; check all that apply)

- Surface Water (A1)
- High Water Table (A2)
- Saturation (A3)
- Water Marks (B1)
- Sediment Deposits (B2)
- Drift Deposits (B3)
- Algal Mat or Crust (B4)
- Iron Deposits (B5)
- Inundation Visible on Aerial Imagery (B7)
- Water-Stained Leaves (B9)
- Salt Crust (B11)
- Aquatic Invertebrates (B13)
- Hydrogen Sulfide Odor (C1)
- Dry-Season Water Table (C2)
- Oxidized Rhizospheres on Living Roots (C3) (where not tilled)
- Presence of Reduced Iron (C4)
- Thin Muck Surface (C7)
- Other (Explain in Remarks)

Secondary Indicators (minimum of two required)

- Surface Soil Cracks (B6)
- Sparsely Vegetated Concave Surface (B8)
- Drainage Patterns (B10)
- Oxidized Rhizospheres on Living Roots (C3) (where tilled)
- Crayfish Burrows (C8)
- Saturation Visible on Aerial Imagery (C9)
- Geomorphic Position (D2)
- FAC-Neutral Test (D5)
- Frost-Heave Hummocks (D7) (LRR F)

Field Observations:

Surface Water Present? Yes No Depth (inches): _____
 Water Table Present? Yes No Depth (inches): _____
 Saturation Present? (includes capillary fringe) Yes No Depth (inches): _____

Wetland Hydrology Present? Yes No

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Remarks:

One secondary indicator geomorphic position (D2) is present. There is a large trapezoidal channel.

WETLAND DETERMINATION DATA FORM – Great Plains Region

Project/Site: Loop 1604 from SH 16 to I-35 City/County: Bexar County Sampling Date: 08.01.2019
 Applicant/Owner: TxDOT State: TX Sampling Point: WDP7_AB_8.1
 Investigator(s): Walt Meitzen, Austin Blase Section, Township, Range: N/A
 Landform (hillslope, terrace, etc.): Terrace Local relief (concave, convex, none): None Slope (%): 0-1
 Subregion (LRR): LRR I Lat: 29.59526233 Long: -98.57192323 Datum: NAD 83
 Soil Map Unit Name: Cb - Crawford and Bexar stony soils NWI classification: R4SBA

Are climatic / hydrologic conditions on the site typical for this time of year? Yes No (If no, explain in Remarks.)
 Are Vegetation , Soil , or Hydrology significantly disturbed? Are "Normal Circumstances" present? Yes No
 Are Vegetation , Soil , or Hydrology naturally problematic? (If needed, explain any answers in Remarks.)

SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present? Yes <input checked="" type="checkbox"/> No <input type="checkbox"/> Hydric Soil Present? Yes <input type="checkbox"/> No <input checked="" type="checkbox"/> Wetland Hydrology Present? Yes <input checked="" type="checkbox"/> No <input type="checkbox"/>	Is the Sampled Area within a Wetland? Yes <input type="checkbox"/> No <input checked="" type="checkbox"/>
Remarks: Two of the three necessary wetland indicators are present. The WDP is not located within a wetland.	

VEGETATION – Use scientific names of plants.

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Remarks:

Three primary indicators sediment deposits (B2), drift deposits (B3), and oxidized rhizospheres on living roots (C3), and two secondary indicators drainage patterns (B10) and geomorphic position(D2) are present.

WETLAND DETERMINATION DATA FORM – Great Plains Region

Project/Site: Loop 1604 from SH 16 to I-35 City/County: Bexar County Sampling Date: 08.07.2019
 Applicant/Owner: TxDOT State: TX Sampling Point: WDP7_CMP_8.7
 Investigator(s): Walt Meitzen, Corey Pursell Section, Township, Range: N/A
 Landform (hillslope, terrace, etc.): Depression Local relief (concave, convex, none): Concave Slope (%): 0-2
 Subregion (LRR): LRR I Lat: 29.57197292 Long: -98.33608217 Datum: NAD 83
 Soil Map Unit Name: HoD3 - Heiden-Ferris complex, 5 to 10 percent slopes, severely eroded NWI classification: None

Are climatic / hydrologic conditions on the site typical for this time of year? Yes No (If no, explain in Remarks.)
 Are Vegetation , Soil , or Hydrology significantly disturbed? Are "Normal Circumstances" present? Yes No
 Are Vegetation , Soil , or Hydrology naturally problematic? (If needed, explain any answers in Remarks.)

SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present? Yes <input checked="" type="checkbox"/> No <input type="checkbox"/> Hydric Soil Present? Yes <input type="checkbox"/> No <input checked="" type="checkbox"/> Wetland Hydrology Present? Yes <input checked="" type="checkbox"/> No <input type="checkbox"/>	Is the Sampled Area within a Wetland? Yes <input type="checkbox"/> No <input checked="" type="checkbox"/>
Remarks: Two of the three necessary wetland indicators are present. The WDP is not located within a wetland.	

VEGETATION – Use scientific names of plants.

Remarks:
 The vegetative community passes the dominance test.

SOIL

Sampling Point: WDP7_CMP_8.7

Profile Description: (Describe to the depth needed to document the indicator or confirm the absence of indicators.)

Depth (inches)	Matrix		Redox Features				Texture	Remarks
	Color (moist)	%	Color (moist)	%	Type ¹	Loc ²		
0-6	10 YR 3/1	100	None				Clay	
6-14	5 YR 2.5/1	100	None				Clay	Gravel present

¹Type: C=Concentration, D=Depletion, RM=Reduced Matrix, CS=Covered or Coated Sand Grains. ²Location: PL=Pore Lining, M=Matrix.

Hydric Soil Indicators: (Applicable to all LRRs, unless otherwise noted.)

- Histosol (A1)
- Histic Epipedon (A2)
- Black Histic (A3)
- Hydrogen Sulfide (A4)
- Stratified Layers (A5) (LRR F)
- 1 cm Muck (A9) (LRR F, G, H)
- Depleted Below Dark Surface (A11)
- Thick Dark Surface (A12)
- Sandy Mucky Mineral (S1)
- 2.5 cm Mucky Peat or Peat (S2) (LRR G, H)
- 5 cm Mucky Peat or Peat (S3) (LRR F)
- Sandy Gleyed Matrix (S4)
- Sandy Redox (S5)
- Stripped Matrix (S6)
- Loamy Mucky Mineral (F1)
- Loamy Gleyed Matrix (F2)
- Depleted Matrix (F3)
- Redox Dark Surface (F6)
- Depleted Dark Surface (F7)
- Redox Depressions (F8)
- High Plains Depressions (F16) (MLRA 72 & 73 of LRR H)

Indicators for Problematic Hydric Soils³:

- 1 cm Muck (A9) (LRR I, J)
- Coast Prairie Redox (A16) (LRR F, G, H)
- Dark Surface (S7) (LRR G)
- High Plains Depressions (F16) (LRR H outside of MLRA 72 & 73)
- Reduced Vertic (F18)
- Red Parent Material (TF2)
- Very Shallow Dark Surface (TF12)
- Other (Explain in Remarks)

³Indicators of hydrophytic vegetation and wetland hydrology must be present, unless disturbed or problematic.

Restrictive Layer (if present):

Type: None
 Depth (inches): N/A

Hydric Soil Present? Yes No

Remarks:

Hydric soil indicators are not present.

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (minimum of one required; check all that apply)

- Surface Water (A1)
- High Water Table (A2)
- Saturation (A3)
- Water Marks (B1)
- Sediment Deposits (B2)
- Drift Deposits (B3)
- Algal Mat or Crust (B4)
- Iron Deposits (B5)
- Inundation Visible on Aerial Imagery (B7)
- Water-Stained Leaves (B9)

- Salt Crust (B11)
- Aquatic Invertebrates (B13)
- Hydrogen Sulfide Odor (C1)
- Dry-Season Water Table (C2)
- Oxidized Rhizospheres on Living Roots (C3) (where not tilled)
- Presence of Reduced Iron (C4)
- Thin Muck Surface (C7)
- Other (Explain in Remarks)

Secondary Indicators (minimum of two required)

- Surface Soil Cracks (B6)
- Sparsely Vegetated Concave Surface (B8)
- Drainage Patterns (B10)
- Oxidized Rhizospheres on Living Roots (C3) (where tilled)
- Crayfish Burrows (C8)
- Saturation Visible on Aerial Imagery (C9)
- Geomorphic Position (D2)
- FAC-Neutral Test (D5)
- Frost-Heave Hummocks (D7) (LRR F)

Field Observations:

Surface Water Present? Yes No Depth (inches): _____
 Water Table Present? Yes No Depth (inches): 7"
 Saturation Present? (includes capillary fringe) Yes No Depth (inches): 3"

Wetland Hydrology Present? Yes No

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Remarks:

Two primary indicators high water table (A2) and saturation (A3) are present.

SOIL

Sampling Point: WDP8_CMP_8.6

Profile Description: (Describe to the depth needed to document the indicator or confirm the absence of indicators.)

Depth (inches)	Matrix		Redox Features				Texture	Remarks
	Color (moist)	%	Color (moist)	%	Type ¹	Loc ²		
0-8	10 YR 3/2	100					Silty Loam	
8-18	10 YR 2/2	98	10 YR 3/6	2	C	PL	Clay Loam	

¹Type: C=Concentration, D=Depletion, RM=Reduced Matrix, CS=Covered or Coated Sand Grains. ²Location: PL=Pore Lining, M=Matrix.

Hydric Soil Indicators: (Applicable to all LRRs, unless otherwise noted.)

- Histosol (A1)
- Histic Epipedon (A2)
- Black Histic (A3)
- Hydrogen Sulfide (A4)
- Stratified Layers (A5) (LRR F)
- 1 cm Muck (A9) (LRR F, G, H)
- Depleted Below Dark Surface (A11)
- Thick Dark Surface (A12)
- Sandy Mucky Mineral (S1)
- 2.5 cm Mucky Peat or Peat (S2) (LRR G, H)
- 5 cm Mucky Peat or Peat (S3) (LRR F)
- Sandy Gleyed Matrix (S4)
- Sandy Redox (S5)
- Stripped Matrix (S6)
- Loamy Mucky Mineral (F1)
- Loamy Gleyed Matrix (F2)
- Depleted Matrix (F3)
- Redox Dark Surface (F6)
- Depleted Dark Surface (F7)
- Redox Depressions (F8)
- High Plains Depressions (F16) (MLRA 72 & 73 of LRR H)

Indicators for Problematic Hydric Soils³:

- 1 cm Muck (A9) (LRR I, J)
 - Coast Prairie Redox (A16) (LRR F, G, H)
 - Dark Surface (S7) (LRR G)
 - High Plains Depressions (F16) (LRR H outside of MLRA 72 & 73)
 - Reduced Vertic (F18)
 - Red Parent Material (TF2)
 - Very Shallow Dark Surface (TF12)
 - Other (Explain in Remarks)
- ³Indicators of hydrophytic vegetation and wetland hydrology must be present, unless disturbed or problematic.

Restrictive Layer (if present):

Type: None
 Depth (inches): N/A

Hydric Soil Present? Yes No

Remarks:

Hydric soil indicators are not present.

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (minimum of one required; check all that apply)

- Surface Water (A1)
- High Water Table (A2)
- Saturation (A3)
- Water Marks (B1)
- Sediment Deposits (B2)
- Drift Deposits (B3)
- Algal Mat or Crust (B4)
- Iron Deposits (B5)
- Inundation Visible on Aerial Imagery (B7)
- Water-Stained Leaves (B9)
- Salt Crust (B11)
- Aquatic Invertebrates (B13)
- Hydrogen Sulfide Odor (C1)
- Dry-Season Water Table (C2)
- Oxidized Rhizospheres on Living Roots (C3) (where not tilled)
- Presence of Reduced Iron (C4)
- Thin Muck Surface (C7)
- Other (Explain in Remarks)

Secondary Indicators (minimum of two required)

- Surface Soil Cracks (B6)
- Sparsely Vegetated Concave Surface (B8)
- Drainage Patterns (B10)
- Oxidized Rhizospheres on Living Roots (C3) (where tilled)
- Crayfish Burrows (C8)
- Saturation Visible on Aerial Imagery (C9)
- Geomorphic Position (D2)
- FAC-Neutral Test (D5)
- Frost-Heave Hummocks (D7) (LRR F)

Field Observations:

Surface Water Present? Yes No Depth (inches): _____
 Water Table Present? Yes No Depth (inches): _____
 Saturation Present? (includes capillary fringe) Yes No Depth (inches): _____

Wetland Hydrology Present? Yes No

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Remarks:

Two secondary indicators drainage patterns (B8) and geomorphic position (D2) are present.

WETLAND DETERMINATION DATA FORM – Great Plains Region

Restrictive Layer (if present):

Type: Limestone rubble
 Depth (inches): 7"

Hydric Soil Present? Yes No

Remarks:

Hydric soil indicators are not present.

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (minimum of one required; check all that apply)

- Surface Water (A1)
- High Water Table (A2)
- Saturation (A3)
- Water Marks (B1)
- Sediment Deposits (B2)
- Drift Deposits (B3)
- Algal Mat or Crust (B4)
- Iron Deposits (B5)
- Inundation Visible on Aerial Imagery (B7)
- Water-Stained Leaves (B9)
- Salt Crust (B11)
- Aquatic Invertebrates (B13)
- Hydrogen Sulfide Odor (C1)
- Dry-Season Water Table (C2)
- Oxidized Rhizospheres on Living Roots (C3)
- (where not tilled)
- Presence of Reduced Iron (C4)
- Thin Muck Surface (C7)
- Other (Explain in Remarks)

Secondary Indicators (minimum of two required)

- Surface Soil Cracks (B6)
- Sparsely Vegetated Concave Surface (B8)
- Drainage Patterns (B10)
- Oxidized Rhizospheres on Living Roots (C3)
- (where tilled)
- Crayfish Burrows (C8)
- Saturation Visible on Aerial Imagery (C9)
- Geomorphic Position (D2)
- FAC-Neutral Test (D5)
- Frost-Heave Hummocks (D7) (LRR F)

Field Observations:

Surface Water Present? Yes No Depth (inches): _____
 Water Table Present? Yes No Depth (inches): _____
 Saturation Present? (includes capillary fringe) Yes No Depth (inches): _____

Wetland Hydrology Present? Yes No

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Remarks:

Two secondary indicators drainage patterns (B10) and geomorphic position (D2) are present.

WETLAND DETERMINATION DATA FORM – Great Plains Region

Project/Site: Loop 1604 from SH 16 to I-35 City/County: Bexar County Sampling Date: 08.08.2019
 Applicant/Owner: TxDOT State: TX Sampling Point: WDP12_AB_8.8
 Investigator(s): Austin Blase, Claire Parra Section, Township, Range: N/A
 Landform (hillslope, terrace, etc.): Terrace Local relief (concave, convex, none): None Slope (%): 0-1
 Subregion (LRR): LRR I Lat: 29.58448369 Long: -98.34804529 Datum: NAD 83
 Soil Map Unit Name: Tf - Tinn and Frio soils, 0 to 1 percent slopes, frequently flooded NWI classification: None

Are climatic / hydrologic conditions on the site typical for this time of year? Yes No (If no, explain in Remarks.)
 Are Vegetation , Soil , or Hydrology significantly disturbed? Are "Normal Circumstances" present? Yes No
 Are Vegetation , Soil , or Hydrology naturally problematic? (If needed, explain any answers in Remarks.)

SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present? Yes <input type="checkbox"/> No <input checked="" type="checkbox"/> Hydric Soil Present? Yes <input type="checkbox"/> No <input checked="" type="checkbox"/> Wetland Hydrology Present? Yes <input type="checkbox"/> No <input checked="" type="checkbox"/>	Is the Sampled Area within a Wetland? Yes <input type="checkbox"/> No <input checked="" type="checkbox"/>
Remarks: None of the necessary wetland indicators are present. The WDP is not located within a wetland.	

VEGETATION – Use scientific names of plants.

						Hydric Soil Present? Yes <input type="checkbox"/> No <input checked="" type="checkbox"/>		
Remarks: Hydric soil indicators are not present.								

HYDROLOGY

Wetland Hydrology Indicators:		
Primary Indicators (minimum of one required; check all that apply)	Secondary Indicators (minimum of two required)	
<input type="checkbox"/> Surface Water (A1)	<input type="checkbox"/> Salt Crust (B11)	<input type="checkbox"/> Surface Soil Cracks (B6)
<input type="checkbox"/> High Water Table (A2)	<input type="checkbox"/> Aquatic Invertebrates (B13)	<input type="checkbox"/> Sparsely Vegetated Concave Surface (B8)
<input type="checkbox"/> Saturation (A3)	<input type="checkbox"/> Hydrogen Sulfide Odor (C1)	<input checked="" type="checkbox"/> Drainage Patterns (B10)
<input checked="" type="checkbox"/> Water Marks (B1)	<input type="checkbox"/> Dry-Season Water Table (C2)	<input type="checkbox"/> Oxidized Rhizospheres on Living Roots (C3)
<input type="checkbox"/> Sediment Deposits (B2)	<input type="checkbox"/> Oxidized Rhizospheres on Living Roots (C3)	(where tilled)
<input type="checkbox"/> Drift Deposits (B3)	(where not tilled)	<input type="checkbox"/> Crayfish Burrows (C8)
<input type="checkbox"/> Algal Mat or Crust (B4)	<input type="checkbox"/> Presence of Reduced Iron (C4)	<input type="checkbox"/> Saturation Visible on Aerial Imagery (C9)
<input type="checkbox"/> Iron Deposits (B5)	<input type="checkbox"/> Thin Muck Surface (C7)	<input checked="" type="checkbox"/> Geomorphic Position (D2)
<input type="checkbox"/> Inundation Visible on Aerial Imagery (B7)	<input type="checkbox"/> Other (Explain in Remarks)	<input type="checkbox"/> FAC-Neutral Test (D5)
<input type="checkbox"/> Water-Stained Leaves (B9)		<input type="checkbox"/> Frost-Heave Hummocks (D7) (LRR F)
Field Observations:		
Surface Water Present?	Yes <input type="checkbox"/> No <input checked="" type="checkbox"/> Depth (inches): _____	
Water Table Present?	Yes <input type="checkbox"/> No <input checked="" type="checkbox"/> Depth (inches): _____	
Saturation Present? (includes capillary fringe)	Yes <input type="checkbox"/> No <input checked="" type="checkbox"/> Depth (inches): _____	Wetland Hydrology Present? Yes <input checked="" type="checkbox"/> No <input type="checkbox"/>
Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:		
Remarks: One primary indicators water marks (B1), and two secondary indicators drainage patterns (B10), and geomorphic position (D2) are present.		

WETLAND DETERMINATION DATA FORM – Great Plains Region

Project/Site: Loop 1604 from SH 16 to I-35 City/County: Bexar County Sampling Date: 07.12.2019
 Applicant/Owner: TxDOT State: TX Sampling Point: WDP15_AB_7.12
 Investigator(s): Walt Meitzen, Austin Blase Section, Township, Range: N/A
 Landform (hillslope, terrace, etc.): Terrace Local relief (concave, convex, none): Convex Slope (%): 0-1
 Subregion (LRR): LRR I Lat: 29.5933346 Long: -98.59947647 Datum: NAD 83
 Soil Map Unit Name: Tf - Tinn and Frio soils, 0 to 1 percent slopes, frequently flooded NWI classification: R4SBA

Are climatic / hydrologic conditions on the site typical for this time of year? Yes _____ No (If no, explain in Remarks.)
 Are Vegetation _____, Soil _____, or Hydrology _____ significantly disturbed? Are "Normal Circumstances" present? Yes No _____
 Are Vegetation _____, Soil _____, or Hydrology _____ naturally problematic? (If needed, explain any answers in Remarks.)

SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present? Yes <input checked="" type="checkbox"/> No _____ Hydric Soil Present? Yes _____ No <input checked="" type="checkbox"/> Wetland Hydrology Present? Yes <input checked="" type="checkbox"/> No _____	Is the Sampled Area within a Wetland? Yes _____ No <input checked="" type="checkbox"/>
Remarks: Wetter than normal conditions were present. Two of the three necessary wetland indicators are present. The WDP is not located within a wetland.	

VEGETATION – Use scientific names of plants.

Tree Stratum (Plot size: <u>30'</u>)	Absolute % Cover	Dominant Species?	Indicator Status

Attachment G
Detailed Descriptions of Waters of the U.S. Crossings

Attachment G: Detailed Descriptions of Waters of the U.S. Crossings

Note: Content in parentheses following the crossing number indicates the features associated with the crossing. "E" followed by a number indicates the easement number associated with the feature (corresponds to the numbering on the figures in Attachment A). Some features are not associated with an easement.

Crossing 1 (Water 1, unnamed tributary to French Creek, E2)

Water 1 consists of two disconnected channels northwest of Loop 1604, each with an OHWM of approximately three feet. Some small pools of standing water were observed at the time of the field visit. Dominant vegetation consisted of cedar elm (*Ulmus crassifolia*) in the tree layer, Drummond's rattlebox (*Sesbania drummondii*) in the shrub layer, and marsh bristlegrass (*Setaria parviflora*) in the herb stratum.

Crossing 2 (French Creek, E3)

French Creek is impounded southeast of Loop 1604. No water was observed in the creek northwest of Loop 1604. On the first field visit, open (impounded) water reached to the culvert apron and a hazardous materials trap. The level had fallen by the next visit, which indicates considerable fluctuation is possible. Dominant vegetation consisted of red mulberry (*Morus rubra*) in the tree layer, Drummond's rattlebox and huisache (*Vachellia farnesiana*) in the shrub layer, curly dock (*Rumex crispus*) and Johnsongrass (*Sorghum halepense*) in the herb stratum, and southern dewberry (*Rubus trivialis*) in the vine stratum.

Crossing 3 (Water 2, unnamed tributary to French Creek, E4)

Water 2 had an OHWM of approximately twelve feet with no water in the channel. Dominant vegetation consisted of cedar elm and huisache in the tree layer, whitebrush (*Aloysia gratissima*) in the shrub layer, and perennial ryegrass (*Lolium perenne*) and spreading hedge parsley (*Torilis arvensis*) in the herb stratum.

Crossing 4 (Water 3 and Water 4, unnamed tributaries to French Creek, E5a)

Water 4 joined Water 3 northwest of the project area. The features each had an OHWM of approximately eleven feet with no water within the channel. Dominant vegetation consisted of cedar elm in the tree layer and shrub layer, straggler daisy (*Calypocarpus vialis*) in the herb stratum and saw-tooth greenbrier (*Smilax bona-nox*) in the vine stratum.

Crossing 5 (Huesta Creek, E5b)

Huesta Creek had an OHWM of approximately twenty-one feet. No water was observed in the channel. Dominant vegetation consisted of Caucasian bluestem (*Bothriochloa bladhii*), giant ragweed (*Ambrosia trifida*), and Johnsongrass in the herb stratum.

Crossing 6 (Water 5, unnamed tributary to Huesta Creek, E6)

Water 5 had an OHWM of approximately eleven feet with no water in the channel. The feature drains from south to north. The feature ended near what was apparently an unimproved access road outside of the existing right-of-way. Dominant vegetation consisted of retama (*Parkinsonia aculeata*) in the tree layer, and Canada wildrye (*Elymus canadensis*) and Mexican petunia (*Ruellia simplex*) in the herb stratum.

Crossing 7 (Water 6, unnamed tributary to Huesta Creek, E7)

Water 6 had an OHWM of approximately five feet with no water in the channel. Dominant vegetation consisted of marsh bristlegrass, Bermudagrass (*Cynodon dactylon*), and green flatsedge (*Cyperus virens*) in the herb stratum.

Crossing 8 (Water 7 and Water 8, unnamed tributaries to Huesta Creek, E8)

Crossing 8 is composed of Water 7 and Water 8. The features had OHWMs of approximately seven feet for Water 7 and nine feet for Water 8, with no water in the channel of either feature. Dominant vegetation consisted of plateau live oak (*Quercus fusiformis*), Ashe juniper (*Juniperus ashei*), retama, and huisache in the tree stratum, evergreen sumac (*Rhus virens*) in the shrub stratum, and Johnsongrass in the herb stratum.

Crossing 9 (Water 9, unnamed tributary to Huesta Creek, E9)

Water 9 had an OHWM of approximately four feet with approximately four inches of standing water. Dominant vegetation consisted of cedar elm, Ashe juniper, and black willow (*Salix nigra*) in the tree stratum, Rooseveltweed (*Baccharis neglecta*) in the shrub stratum, Johnsongrass, and Vasey grass (*Paspalum urvillei*) in the herb stratum, and Japanese honey suckle (*Lonicera japonicum*), and southern dewberry in the vine stratum.

Crossing 10 (Water 10, unnamed tributary to Leon Creek)

Water 10 had an OHWM of approximately ten feet with no water in the channel. Dominant vegetation consisted of plateau live oak in the tree stratum, evergreen sumac in the shrub stratum, and giant ragweed in the herb stratum.

Crossing 11 (Water 11, unnamed tributary to Leon Creek, E10)

Water 11 had an OHWM of approximately 24 feet with no water in the channel. Dominant vegetation consisted of plateau live oak in the tree stratum, Rooseveltweed in the shrub stratum, and Bermudagrass in the herb stratum.

Crossing 12 (Leon Creek)

Leon Creek had an OHWM of approximately 32 feet with no water in the channel. Dominant vegetation consisted of red mulberry, huisache, and black willow in the tree stratum, eastern

cottonwood (*Populus deltoides*), cedar elm, and Rooseveltweed in the shrub stratum, giant ragweed and hedge parsley in the herb stratum, and southern dewberry in the vine stratum.

Crossing 13 (Leon Creek, E11)

Leon Creek had an OHWM of approximately 30 feet with no water in the channel. Dominant vegetation consisted of green ash (*Fraxinus pennsylvanica*) in the tree stratum, eastern cottonwood, cedar elm, and Rooseveltweed in the shrub stratum, giant ragweed and hedge parsley in the herb stratum, and southern dewberry in the vine stratum.

Crossing 14 (Leon Creek)

Leon Creek had an OHWM of approximately 13 feet with no water in the channel. Dominant vegetation consisted of green ash in the tree stratum, Drummond's rattlebox in the shrub stratum, and giant ragweed and Bermudagrass in the herb stratum.

Crossing 15 (Leon Creek, Wetland 1)

Leon Creek had an OHWM of approximately 17 feet with no water in the channel. Wetland 1 is an adjacent wetland. Dominant vegetation consisted of green ash in the tree stratum, green ash in the shrub stratum, and swamp smartweed (*Persicaria hydropiperoides*) and Bermudagrass in the herb stratum.

Crossing 16 (Water 12, Wetland 2, unnamed tributary to Leon Creek, E14)

Water 12 had an OHWM of approximately two feet with no water in the channel. Wetland 2 is an adjacent wetland. Dominant vegetation consisted of Shumard oak (*Quercus shumardii*), black willow, and honey mesquite (*Prosopis glandulosa*) in the tree stratum, black willow in the shrub stratum, and Mexican petunia, straggler daisy, and Vasey grass in the herb stratum.

Crossing 17 (Salado Creek, Water 13 and Water 14, unnamed tributaries to Salado Creek, E28 and E29)

Salado Creek had an OHWM of approximately 15 feet with no water in the channel. Water 13 had an OHWM of approximately five feet with no water in the channel. Water 14 had an OHWM of approximately ten feet with no water in the channel. Dominant vegetation consisted of plateau live oak and cedar elm in the tree stratum, sugarberry (*Celtis laevigata*) and Shumard oak in the shrub stratum, and giant ragweed and inland sea oats (*Chasmanthium latifolium*) in the herb stratum.

Crossing 18 (Water 15, unnamed tributary to Panther Springs Creek, E31)

Water 15 had an OHWM of approximately ten feet with no water in the channel. Dominant vegetation consisted of huisache and sugarberry in the tree stratum, plateau live oak and Texas prickly pear (*Opuntia engelmannii*) in the shrub stratum, and little bluestem (*Schizachyrium scoparium*) and King Ranch bluestem (*Bothriochloa ischaemum*) in the herb stratum.

Crossing 19 (Water 16, unnamed tributary to Panther Springs Creek, E34)

Water 16 had an OHWM of approximately five feet with no water in the channel. Dominant vegetation consisted of huisache and cedar elm in the tree stratum and in the shrub stratum, and giant ragweed and Mexican hat (*Ratibida columnifera*) in the herb stratum.

Crossing 20 (Panther Springs Creek)

Panther Springs Creek had an OHWM of approximately 40 feet with no water in the channel. Dominant vegetation consisted of huisache in the shrub stratum, and giant ragweed and old man's beard (*Clematis vitalba*) in the herb stratum.

Crossing 21 (Lorence Creek, E38)

Lorence Creek had an OHWM of approximately 15 feet with no water in the channel. Dominant vegetation consisted of plateau live oak and huisache in the tree stratum, Texas persimmon (*Diospyrus texana*), and Arizona ash (*Fraxinus velutina*) in the shrub stratum, Canada wildrye and straggler daisy in the herb stratum, and saw-tooth greenbrier in the vine stratum.

Crossing 22 (Mud Creek)

Mud Creek had an OHWM of approximately 32 feet with no water in the channel. Dominant vegetation consisted of huisache and cedar elm in the tree stratum, Texas persimmon, western soapberry (*Sapindus saponaria*), and common hop tree (*Ptelea trifoliata*) in the shrub stratum, and Bermuda grass in the herb stratum.

Crossing 23 (Water 17, unnamed tributary to Elm Creek, E40)

Water 17 had an OHWM of approximately seven feet with no water in the channel. Dominant vegetation consisted of huisache in the tree stratum, sugarberry and fragrant sumac (*Rhus aromatica*) in the shrub stratum, Canada wildrye, thin paspalum (*Paspalum setaceum*), and straggler daisy in the herb stratum, and saw-tooth greenbrier in the vine stratum.

Crossing 24 (Elm Creek, E41)

Elm Creek had an OHWM of approximately 13 feet with no water in the channel. Dominant vegetation consisted of cedar elm and plateau live oak in the tree stratum, cedar elm in the shrub stratum, straggler daisy, Mexican petunia, and thin paspalum in the herb stratum, and southern dewberry and trumpet vine (*Campsis radicans*) in the vine stratum.

Crossing 25 (Elm Waterhole Creek, E45)

Elm Waterhole Creek had an OHWM of approximately 40 feet with no water in the channel. Dominant vegetation consisted of huisache, sugarberry, cedar elm, Chinese tallow (*Triadica sebifera*), and black willow in the tree stratum, huisache in the shrub stratum, and rag sumpweed (*Cyclachaena xanthiifolia*), giant ragweed, Virginia wildrye, and southern sedge (*Carex australis*) in the herb stratum, and mustang grape (*Vitis mustangensis*) and saw-tooth greenbrier in the vine stratum.

Crossing 26 (Water 18, unnamed tributary to Elm Waterhole Creek, E48)

Water 18 had an OHWM of approximately five feet with no water in the channel. Dominant vegetation consisted of huisache, sugarberry, black willow, and green ash in the tree stratum, cedar elm and Rooseveltweed in the shrub stratum, giant ragweed and common spike rush (*Eleocharis palustris*) in the herb stratum, and mustang grape and southern dewberry in the vine stratum.

Crossing 27 (Water 19, tributary to Elm Waterhole Creek, E51)

Water 19 had an OHWM of approximately six feet with no water in the channel. Dominant vegetation consisted of Texas ash (*Fraxinus albicans*) and plateau live oak in the tree stratum, sugarberry, cedar elm, and Texas ash in the shrub stratum, straggler daisy and Canada wildrye in the herb stratum, and southern dewberry in the vine stratum.

Crossing 28 (Water 20, tributary to Cibolo Creek, E58)

Water 20 had an OHWM of approximately six feet with no water in the channel during the first visit and two to three inches of standing water during a subsequent visit (after a heavy rain the day prior). Dominant vegetation consisted of box elder (*Acer negundo*) and black hickory (*Carya texana*) in the tree stratum, cedar elm, and honey mesquite in the shrub stratum, and giant ragweed in the herb stratum.

Crossing 29 (Water 21, tributary to Cibolo Creek, E60)

Water 21 had an OHWM of approximately nine feet with no water in the channel. Dominant vegetation consisted of black willow and sugarberry in the tree stratum, black willow and green ash in the shrub stratum, and giant ragweed in the herb stratum.

Crossing 30 (Water 22, tributary to Cibolo Creek, E61)

Water 22 had an OHWM of approximately eight feet with no water in the channel. Vegetation on the south side of the channel is herbaceous while on the north side it is herbaceous and woody. Dominant woody vegetation is green ash and huisache. The herbaceous layer is dominated by giant ragweed.

Crossing 31 (Water 23, tributary to Cibolo Creek, E63 & E64)

Water 23 had an OHWM of approximately 13.5 feet with approximately 12 inches of standing water in the portion with a natural stream bottom. The concrete-lined portion of the channel had one to two inches of standing water. Dominant vegetation consisted of green ash,

huisache, and sugarberry in the tree stratum, green ash and Rooseveltweed in the shrub stratum, Mexican petunia, giant ragweed and Virginia wildrye in the herb stratum, and southern dewberry in the vine stratum.
